Air-cooled Liquid Chiller for outdoor installation (NAC)

Air-to-water Heat Pump for outdoor installation (NAH)

Nominal cooling capacity :

200 ► 1000 kW (NAC)

200 ► 450 kW (NAH)

Nominal heating capacity :

200 ► 500 kW (NAH)

Sustainable Performance

- **Extended qualification tests** (vibration tests, run tests, field tests) to ensure superior reliability.
- **High efficiency aluminium micro channel heat exchanger (MCHX)** with improved corrosion resistance for moderate marine or urban applications (Cooling only version). **3-year warranty***.
- **Specific MCHX coil design** with high mechanical fin resistance that offers easy cleaning with high pressure air or water washers for extended life cycle.
- **V-coil design**, compressor and hydraulic enclosure to protect the unit against climatic conditions (e.g. sun rays, UV light, hail).
- **Exclusive Compliant Scroll® compressor design** with both axial and radial compliance to increase compressor operation tolerance of liquid refrigerant or debris, substantially improving durability and reliability. **3-year warranty***.
- **Exclusive fan design with SKF hybrid Ceramic bearings** to double (treble in some cases) the service life of the motors and to reduce noise level. With these sealed hybrid ceramic bearings, our customer can expect little or no maintenance of the motor throughout its life. **3-year warranty***.

Quiet performance

- **Unique design** with compressor, pump(s) and fan acoustic enclosure to reduce radiated noise emissions.
- **Inverter fans** using external rotor technology associated with high performance aluminium fan blades of the latest generation (Owlet™ design).
- **Elimination of intrusive fan start/stop noise** that is irritating to the human ear.
- **Active Acoustic Attenuation System™** to meet changing building load requirements while automatically adjusting the air flow to meet night and day sound level constraints (Time schedule with 4 time zones per day).

Quick performance and service

- **Complete hydraulic module** with single or twin, low or high pressure pump (options) that includes all necessary equipment for quick connection: pump(s), regulating valve, expansion tank vessel with pressure gauge, pressure tapping points, water filter, air vent, pressure relief valve and Victaulic connections.
- 400V, 50 Hz, 3 phase power supply (without neutral) with a single point of power connection. Main on/off switch included in as standard.
- **Air spring powered Butterfly electrical panel** with jacks top opening providing protection to service engineers against rain or snow during commissioning and maintenance operations.

Energy

performance

- **High Energy Performance** (ESEER above 4; EER up to 2.9 ; COP up to 3,2) for improved energy consumption all around the year.
- **Aluminium micro channel heat exchanger** that offers +10% outstanding system efficiency (cooling only version).
- **R410A refrigerant** for optimized system performance.
- **Energy savings** due to lower system minimum water content reducing the time to reach setpoint. This can also eliminate the need for a buffer tank.

Architectural integration

- **State of the art design** with hidden compressors, fans and pump for perfect architectural integration.
- **Flat top, aesthetic grilles, very low unit height (< 2 m)** for discrete installation on a roof reducing the requirement of costly cladding solutions around the unit.

* This warranty covers parts only. The above warranty is liable if the start-up and periodic maintenance agreement is contracted by a LENNOX company or any company accredited by LENNOX. Refer to LENNOX 3 year warranty conditions.

Flat top and low profile for best architectural integration

The NEOSYS design is minded to be perfectly integrated into urban or residential environments. The state of the art design of NEOSYS includes a painted casing, a flat top that hides the fans and aesthetic protection grilles.

The very low unit height less than two meters makes easier for architects and design engineers to integrate the unit on a roof. Many interviewed customers confirm that the state of the art design of NEOSYS will replace any requirement of costly cladding solutions around the unit.

Smarts acoustics with inverter fans

No more need to make a choice between a high efficiency version, a low noise or an ultra low noise version. NEOSYS can adapt all situations with only one version. NEOSYS is fitted in standard with the Active Acoustic Attenuation System™ that is using an electronic control associated with inverter fans. NEOSYS can change automatically the speed of all the fans – from 0% to 100% of the nominal air flow – to meet the building load requirements while respecting maximum authorised noise level in the time zone. NEOSYS is surely achieving the best acoustic signature of the market thanks to the latest generation of Owlet™ high performance aluminium fan blades and noiseless ceramic bearings.

ACTIVE ACOUSTIC ATTENUATION SYSTEM™

SELECT YOU MODE PER TIME ZONE

Performance Mode

Auto Quiet Mode

Quiet Mode

A high energy performance

Floating high pressure

LENNOX optimizes the performance of the NEOSYS chillers with electronic expansion valve (as an option) and variable speed ventilation (as standard) to achieve maximum energy savings.

We define a condensation temperature depending on the outside air temperature at an optimum value to obtain the lowest power inputs of couples, compressors and condenser fan motors.

By using R410A refrigerant associated with high efficiency micro channel coils and variable speed fans NEOSYS is contributing to a very low energy consumption all year around with an average energy efficiency ratio (ESEER)* in cooling mode above 4.0. NEOSYS Heat-pumps are also achieving very high performances in cooling and heating mode (COP* up to 3.2). Furthermore NEOSYS advanced control allows energy savings all year around by using smart control functions:

- Low water system quantity to reduce the time to reach the set-point.
- Dynamic defrost (patented) to limit the number of defrost cycles.
- Set-point reset based on outside air temperature to relax the chilled water set-point.

*ESEER : European Seasonal Energy Efficiency Ratio in cooling mode.
COP : Coefficient of Performance in heating mode.

R410A Micro channel heat exchanger

With the use of fully aluminium coils already used in the automotive industry, NEOSYS offers many customer benefits:

- Up to 40% less refrigerant charge that contributes to reduce the total amount of refrigerant used in the system.
- A more efficient system (EER + 10%).
- An air heat exchanger with significantly improved corrosion resistance results (x 2) from the same aluminium alloy (no galvanic action) vs. the traditional copper tube/aluminium fin coils. By using this type of coil, units can be used in light corrosive or seacoast environments without any need for additional, and expensive, pre-treated fins or coil coating.
- High mechanical resistance eases the cleaning with high pressure air or water washers without any risk of damaging the fins.

Available in cooling only version, this technology will surely be enlarged shortly to reversible applications.

GENERAL CHARACTERISTICS OF THE UNIT

The NEOSYS unit is designed to be integrated into urban or residential environments.

As main characteristics the NEOSYS unit offers **state of the art design** to match architectural constraints and **adjustable sound level performances** during day and night to satisfy local environmental constraints.

CASING/CHASSIS

- Casing made of galvanised steel sheet metal painted with a white powdered polyester paint and a red stripe.
- Fully grey colour painted chassis protecting against corrosion.
- **State of the art design** with hidden compressors, fans and pump for perfect architectural integration.
- Flat top, aesthetic grilles, **very low unit height (2 meters)** for discrete installation on a roof reducing the requirement of costly cladding solutions around the unit
- **Aesthetic side anti-intrusion grilles** as standard to protect the unit during transportation and against human aggressions.

COMPRESSOR

- Exclusive Compliant Scroll® design with both axial and radial compliance to increase compressor operation tolerance to liquid refrigerant, substantially improving durability and reliability. **3-year warranty***.
- Motor cooled by suction gas.
- Electronic control of the compressor discharge temperature.
- Motor protection device against high temperature or over current situations.
- Discharge non-return valve.
- Low noise scroll compressors mounted in a sound-proofed technical cabinet to reduce noise emissions.
- Compressors assembly installed on an independent chassis supported by anti-vibration mountings.

WATER HEAT EXCHANGER

- True dual circuit plate heat exchanger
- Copper brazed Stainless steel plate heat exchanger.
- 13 mm thermal insulation foam.
- Water heat exchanger located in a technical cabinet protecting the insulation against climatic conditions (UV light, rain).
3-year warranty*

AIR HEAT EXCHANGER

- High efficiency aluminium Micro Channel heat exchangers (MCHX) with improved corrosion resistance in moderate marine or urban environment (cooling only version). **3-year warranty***.
- Standard copper tubes/aluminium fins heat exchanger (heat pump version).
- V-coil design to protect the unit against climatic conditions (e.g. hail).

FANS

- Inverter fans (0 to 900 rpm operating range).
- **Active Acoustic Attenuation System™** to meet changing building load requirements while automatically adjusting the air flow to respect night and day sound level constraints (adjustable setting over time schedule with 4 time zones per day).
- Elimination of intrusive start/stop noise that is irritating to the human ear.
- Fan-motor assembly using external rotor technology associated with owl high performance aluminium fan blades of the latest generation.
- IP 54 electrical motor, class F protected against high temperature with an internal sensor.
- Exclusive fan design with hybrid Ceramic bearings to extend the service life of motors and to reduce noise level. With these sealed hybrid ceramic bearings, our customer can expect little or no maintenance of the motor throughout its life. **3-year warranty***.
- Extremely rigid fan assembly via the integration of the fans mounted within a pre-formed bell mouth roof panel, thus improving rigidity while reducing vibrations.
- Rounded top acoterion panels to hide the fans and reduce noise emissions for quieter operation.

REFRIGERANT CIRCUIT

NEOSYS uses R410A refrigerant in 2 independent circuits (minimum). Each circuit includes:

- **A refrigerant charge reduced by 30%** due to the use of R410A combined with micro channel heat exchanger (NAC/Cooling only version).
- Suction piping with thermal insulation.
- Filter drier with removable cartridge filter.
- Thermostatic or electronic expansion valve (Electronic device only when "winter operation" option selected).
- Temperature sensors and pressure transducers.
- Four-way valve and liquid receiver (heat pump units only).
- Leak-tight refrigerant circuit with brazing carried out under nitrogen by certified engineers.
- Each refrigerant circuit is pressure and leak tested with a Hydrogen/Nitrogen mixture, and vacuumed before being charged with refrigerant. All units are then subjected to a complete functional and operational run test to guarantee perfect sealing before leaving the factory.

* Warranty under conditions - See page 3

ELECTRICAL BOX

- Unit electrical cabinet, components and wiring in compliance with EN 60204-1 electrical directive.
- 400V, 50 Hz, 3 phase power supply (without neutral) with a single point of power connection (except sizes 680 to 1080).
- Bottom entry (through the base) for electrical power.
- IP54 protection class.
- **Air spring powered Butterfly electrical panel** with top opening providing protection to the service engineers against rain or snow during commissioning and maintenance operations.
- Recognized brand electrical components (Schneider) for ease of maintenance.
- Main on/off switch mounted on the front panel.
- DC60 advanced user interface mounted on the front panel.
- Main disconnect switch with high trip capacity allowing optimized sizing of the customer power supply.
- 400/24 V transformer to supply the control circuit.
- Numbered electrical wires to facilitate maintenance and diagnostic.
- Variable Frequency Drives (VFD) to control the fan speed.

CONTROL

CLIMATIC microprocessor based control is providing the following functions:

- 4 scheduling time zones per day over 7 days to allow energy consumption and sound level management according to the building use and environmental constraints.
- PI control of the water temperature with operating time equalisation of the compressors.
- Water set-point offset based on outdoor air temperature.
- **Active variable speed control of all fans** to optimize the unit condensing pressure and energy performances at full- and part-load while meeting authorized maximum noise level in the time zone (Active Acoustic Attenuation System™ control patented).
- Intelligent advanced control algorithm to protect the compressors against excessive short-cycling and to allow **operation of the unit without buffer tank** in most comfort air conditioning applications (e.g. unit with fan-coils). Refer to minimum installation water loop volume recommendations.
- **Dynamic defrost** to limit the number and the duration of the defrost cycles in winter for high performance of the unit (Dynamic Defrost patented).
- Automatic compressor unloading in case of excessive condensing pressure allowing the operation of the machine at high outdoor air temperature (operation extended up to 46°C ambient).
- Water pump control with operating time equalization and automatic change-over in case of a pump fault (Twin pump only).
- Master/slave or cascade control of two chillers operating in parallel with operating time equalization and automatic change-over in case of a unit fault.

CLIMATIC is pre-factory configured with default settings allowing a fast commissioning on site. The DC60 advanced user interface with graphical display is easy to use, intuitive. Main customer parameters can be read or modified without main power shut-off (Entering/leaving water temperatures, outdoor air temperature, alarm history, scheduling of the different time zone, water and noise level set-points, high and low pressure reading).

The DS60 service display (optional) is a "plug and play" controller that allows service people to read and modify all unit parameters (Unit settings, operating time and number of compressor starts, low and high pressure reading, read the history of last 32 faults...).

COMMUNICATION

The control board is equipped with a RS485 serial communication port to allow remote management through communication bus. According to the wished communication protocol, our control board can be fitted with **ModBUS®**, **BacNET® (RS485 or TCP/IP)** or **LonWorks® communication interface** (options).

The main control board has free dry contacts that allow remote control of the unit by wired cable:

- Remote on/off of the unit.
- Remote alarm reset to re-start the unit.
- Alarm or alert indications.
- Free customer contact.

With the optional extension board BE60, it is possible to get additional customized digital or analog inputs / outputs for remote control of the unit:

- Fault fans or pumps (dry contact).
- Operation indication at 100% on circuit 1 or 2 (dry contact).
- Dual water set-point management (dry contact).
- Force heating or cooling mode (24V AC input).
- Power limitation by disabling circuit 1 or 2 (24V AC input).
- Force unoccupied mode (24V AC input).
- Water set-point offset based on a 4-20mA signal. Note: non available with heat-pump units.

DIRECTIVES

The unit is built to meet European norms and standards & Eurovent certification performance standards.

- DI 97/23/CE Pressure Equipment Directive.
- DI 98/37/CE Machinery Directive.
- DI 73/23/CE Low Voltage Directive.
- DI 89/336/CE Electro Magnetic Compatibility Directive
- EN 378-2 Safety and Environmental Directive.
- **The European Restriction of the Use of Certain Hazardous Substances (RoHS).**

| OPTIONS | DESCRIPTION | ADVANTAGES | MODELS |
|--|---|---|----------------------------------|
| Low-pressure single-pump hydraulic module | Low-pressure single pump, regulating valve, Victaulic couplings, filter and all necessary hydraulic devices. Refer to specific chapter. | Quick start-up on job site. Available pressure around 150 kPa. | NAC 200 ► 640 NAH 200 ► 480 |
| High-pressure single-pump hydraulic module | High-pressure single pump, regulating valve, Victaulic couplings, filter and all necessary hydraulic devices. Refer to specific chapter. | Quick start-up on job site. Available pressure around 250 kPa. | NAC 200 ► 640 NAH 200 ► 480 |
| Low-pressure twin-pump hydraulic module | Low-pressure twin pumps, regulating valve, Victaulic couplings, filter and all necessary hydraulic devices. Refer to specific chapter. | Quick start-up on job site. Available pressure around 150 kPa. | NAC 200 ► 640 NAH 200 ► 480 |
| High-pressure twin-pump hydraulic module | High-pressure twin pumps, regulating valve, Victaulic couplings, filter and all necessary hydraulic devices. Refer to specific chapter. | Quick start-up on job site. Available pressure around 250 kPa. | NAC 200 ► 640 NAH 200 ► 480 |
| Partial heat recovery | Plate heat exchanger on each compressor circuit allowing recovery of 20% of the rejected heat | Allow free hot water production simultaneously with unit operation | NAC 200 ► 640 NAH 200 ► 300 |
| Free cooling | Additional free cooling coils (one "V" or two "V" depending on needed capacity) with inverter fans and motorised valves. | Allow the chilled water to run through the free-cooling system, which uses less power and utilises the lower ambient air to cool the water. | NAC 200 ► 540 |
| Winter operation (from +6°C down to -20°C) – Cooling only units | Unit fitted with electronic expansion valve and variable frequency driven fans. Select "anti-freeze protection" option if no glycol water | Increased operating range in cooling down to -20°C ambient temperature. (Standard on sizes 540/600/640/1080). | NAC 200 ► 480 NAC 680 ► 960 |
| Brine operation (From +5°C down to -10°C) | Unit fitted with electronic expansion valve, variable frequency driven fans and reinforced evaporator and piping thermal insulation. | Increased operating range in cooling down to -10°C water leaving temperature for thermal storage or process cooling. | NAC 200 ► 1080 |
| Anti-freeze protection (down to -20°C) | Resistance heaters on the evaporator, hydraulic module and partial heat recovery if selected. To be selected if no glycol water. | Evaporator and hydraulic module frost protection down to -20°C ambient temperature | NAC 200 ► 1080 NAH 200 ► 480 |
| Heavy anti-corrosion coil treatment | Application of LenGuard treatment on the entire coil surface. | High corrosion resistance for severe industrial, marine and dirty environments. | NAC 200 ► 1080 NAH 200 ► 480 |
| Rear protection grille | Metallic grille fitted at the back of the unit | Prevents the rear V-coil against possible damage | NAC 200 ► 640 NAH 200 ► 480 |
| Soft starter | Electronic soft starter fitted into the electrical cabinet | Start-up current reduced by 15 % up to 30 %. | NAC 200 ► 1080* NAH 200 ► 480 |
| Power Factor correction | Capacitors fitted into the unit | Cos phi correction up to 0.95 to reduce current and energy consumption. | NAC 200 ► 1080 NAH 200 ► 480 |

*except in case of main power connection option

| OPTIONS | DESCRIPTION | ADVANTAGES | MODELS |
|--|---|---|---------------------------------|
| Electric meter | Active energy total counter, power factor, operating time counter, max. active power demand, ModBus. | This device allows monitoring of the unit electric power consumption on the unit and from a BMS | NAC 200 ► 1080 NAH 200 ► 480 |
| Single main power connection | Electrical cabinet equipped with one single point of connection and power cut-off for the complete unit. | Allow easy electrical connection with one single cable instead of two cables | NAC 680 ► 1080 |
| BE60 extension board for additional inputs/outputs | Electronic extension board with additional analog inputs (4), digital inputs (4) and digital outputs (4). See control manual. | Relay card for remote control and alarm report using dry contacts, 24 Vac or 4-20 mA signals. | NAC 200 ► 1080 NAH 200 ► 480 |
| Modbus communication interface | Communication card using ModBus/JBus protocol with RS485 or TCP/IP connection. | Communication interface with a building management system. | NAC 200 ► 1080 NAH 200 ► 480 |
| LonWorks® communication interface | Communication card using LonTalk® protocol with FTT-10A connection. | Communication interface with a building management system. | NAC 200 ► 1080 NAH 200 ► 480 |

MINIMUM WATER CONTENT OF AN INSTALLATION

Thanks to multi step capacity control and smart anti-short compressor cycling, NEOSYS can work with minimum water loop volume as defined here below. This can eliminate the need for a buffer tank in most of air-conditioning applications (e.g. NEOSYS application with fan-coil units).

$$V_{\text{mini}} = 86 \times Q / (N_{\text{stages}} \times Dt)$$

| | | |
|---------|---------------|--|
| Where : | V | Minimum water content of the installation |
| | Q | Cooling capacity of the chiller |
| | Nstage | Number of control steps available in the unit |
| | Dt | Maximum acceptable temperature rise (Dt = 6°C for an air conditioning application) |

Important note: In case NEOSYS is used in air-conditioning applications with a short water system (e.g. NEOSYS application with air handling units) or in case NEOSYS is used for industrial process cooling, it is mandatory to use a buffer tank.

MINIMUM WATER CONTENT OF AN INSTALLATION

| Unit Size | Number of stages | Mini water volume (l) |

MAXIMUM WATER CONTENT OF AN INSTALLATION

The maximum water content of the installation is determined by the capacity of the expansion vessel.
 On units fitted with a standard Hydraulic Module it is possible to determine the maximum water content of the installation.

| Unit Size | Expansion vessel volume | Pressure in the expansion vessel | Max. volume clear water (l) | | Max. volume Glycol water (l) | |
|---|-------------------------|----------------------------------|-----------------------------|---------|------------------------------|---------|
| | | | Static pressure | | Static pressure | |
| | | | 5 m | 10 m | 5 m | 10 m |
| 200-230-270 300-340-380 420-480 540 600-640 | 50 l | 1,5 Bar | 5 230 l | 4 180 l | 4 020 l | 3 210 l |

GLYCOL CORRECTION FACTOR

| Minimum ambient temperature or water outlet temperature | Ethylene glycol | Pressure drop | Water flow | CAPACITIES | |
|---|-----------------|---------------|------------|------------|---------|
| | | | | Cooling | Heating |
| + 5°C ► 0°C | 10% | 1,05 | 1,02 | 0,99 | 0,994 |
| 0°C ► -5°C | 20% | 1,10 | 1,05 | 0,98 | 0,993 |
| - 5°C ► -10°C | 30% | 1,15 | 1,08 | 0,97 | 0,99 |
| - 10°C ► -15°C | 35% | 1,18 | 1,10 | 0,96 | 0,987 |

Example : 10% glycol
 Minimum flow : 1,19 m³/h x 1,02
 Pressure drop x 1,07
 System capacity x 0,99

MINIMUM WATER FLOW THROUGH THE EVAPORATOR

In case of installation with fixed speed pump, to prevent from freezing risk, the flow rate through the evaporator must be higher than the minimum flow given in the table below.

In case of variable primary flow, the pump speed must be controlled through the CLIMATIC control. Additionally, the hydraulic system must be properly designed and balanced to ensure a right water flow distribution through the chiller evaporator and the terminal units. This is especially important when the system is designed with fan coils equipped with two-way valves. When the two-way valves are closing in response to building load change, it is important that the system is designed to ensure a minimum evaporator flow that is always minimum 60% of the chiller's design flow rate. This can be done with a bypass from chilled water supply to chilled water return opened via a signal from a flow meter.

Additionally, some terminals can be fitted with three way control valves in order to ensure the flow will not drop below the minimum value at any load condition as indicated in the table below.

| Models | Capacity (kW) | Water flow rate (m ³ /h) | | |
|--------|---------------|--|---------|---------|
| | | Minimum (with fixed and eDrive™ variable speed pump) | Nominal | Maximum |
| 200 | 208 | 21,5 | 35,8 | 57,9 |
| 230 | 236 | 24,4 | 40,6 | 57,9 |
| 270 | 273 | 28,1 | 46,9 | 57,9 |
| 300 | 308 | 31,7 | 52,9 | 126,4 |
| 340 | 351 | 36,2 | 60,4 | 126,4 |
| 380 | 387 | 40,0 | 66,6 | 126,4 |
| 420 | 430 | 44,3 | 73,9 | 126,4 |
| 480 | 490 | 50,6 | 84,3 | 126,4 |
| 540 | 531 | 54,8 | 91,3 | 126,4 |
| 600 | 605 | 62,5 | 104,1 | 126,4 |
| 640 | 627 | 64,7 | 107,9 | 126,4 |
| 680 | 702 | 72,6 | 121,0 | 252,9 |
| 760 | 774 | 80,1 | 133,4 | 252,9 |
| 840 | 860 | 88,8 | 148,0 | 252,9 |
| 960 | 980 | 101,3 | 168,8 | 252,9 |
| 1080 | 1062 | 109,7 | 182,9 | 252,9 |

Important note : The water flow must not vary by more than 10% per minute. If the flow rate changes more rapidly, the system should contain a minimum of 6,5 litres of water per kW instead of 3 l/kW.

eDrive™ TECHNOLOGY, THE RIGHT CHOICE TO SAVE 75% OF PUMP ENERGY COSTS.

LENNOX offers the eDrive, a variable speed drive pump option (with single or double pump) which modulates the water flow through the evaporator and reduces energy costs. This option is available on chillers and heat pumps from 20 to 1000 kW.

In a water system, one major contributor to annual energy consumption is the pump motor. Pumping energy cost can represent 20% of the total cost of owning a chiller. This ratio can be even bigger for a heat-pump.

eDrive™ variable speed driven pump is contributing to continuous Lennox efforts to save energy while exploring possibilities to reduce installation cost.

eDrive™ variable speed driven pump benefits:

- Cost savings on the energy consumption especially at part-load conditions and during off period. 75% of this energy could be saved !
- Cost savings on the initial system cost. Fewer pumps and piping connections than primary–secondary systems, terminal units equipped with two-way control valves instead of three-way valves, elimination of water flow set valve.
- Flexibility and accuracy in the pump operation control (smooth start and stop, gradual change of speed, accuracy and stability of control)
- Reduction of the repeated stress on the pump and piping resulting in longer equipment life time (elimination of the «hammer blow» in pipes).
- Elimination of the start-up current thanks to variable frequency drive that controls a gradual pump motor supply.

Designing a VWF chilled water plant that performs reliably at all load conditions requires careful attention to chiller design. Thanks to the newest generation of chiller controllers and intensive testing, NEOSYS can now reliably maintain the desired chilled water temperature with a flow range from 60% to 100% that gives up to 75% annual energy savings.

LENNOX eDrive™ Technology modulates the Water Flow especially in Part-Load Conditions through a Specific Algorithm and a Variable Frequency Driver.

Typical cost split in a chiller through 15-year lifespan

Chiller with fixed speed pump

Chiller with variable speed pump

| | |
|---------------------|------------------|
| Cooling energy cost | Maintenance cost |
| Equipment cost | Pump energy cost |

eDrive™ VARIABLE WATER FLOW SAVES YOUR MONEY IN THE ENERGY COST

- Through the elimination of the energy normally lost in the water flow control valve during unit full-load operation (Variable water flow = perfect pump curve adjustment to the required nominal water flow and delta P)
- Through pump rotation speed reduction during unit part-load operation.
- Thanks to pump running at minimum speed during Chiller “off” period (night, unoccupied)

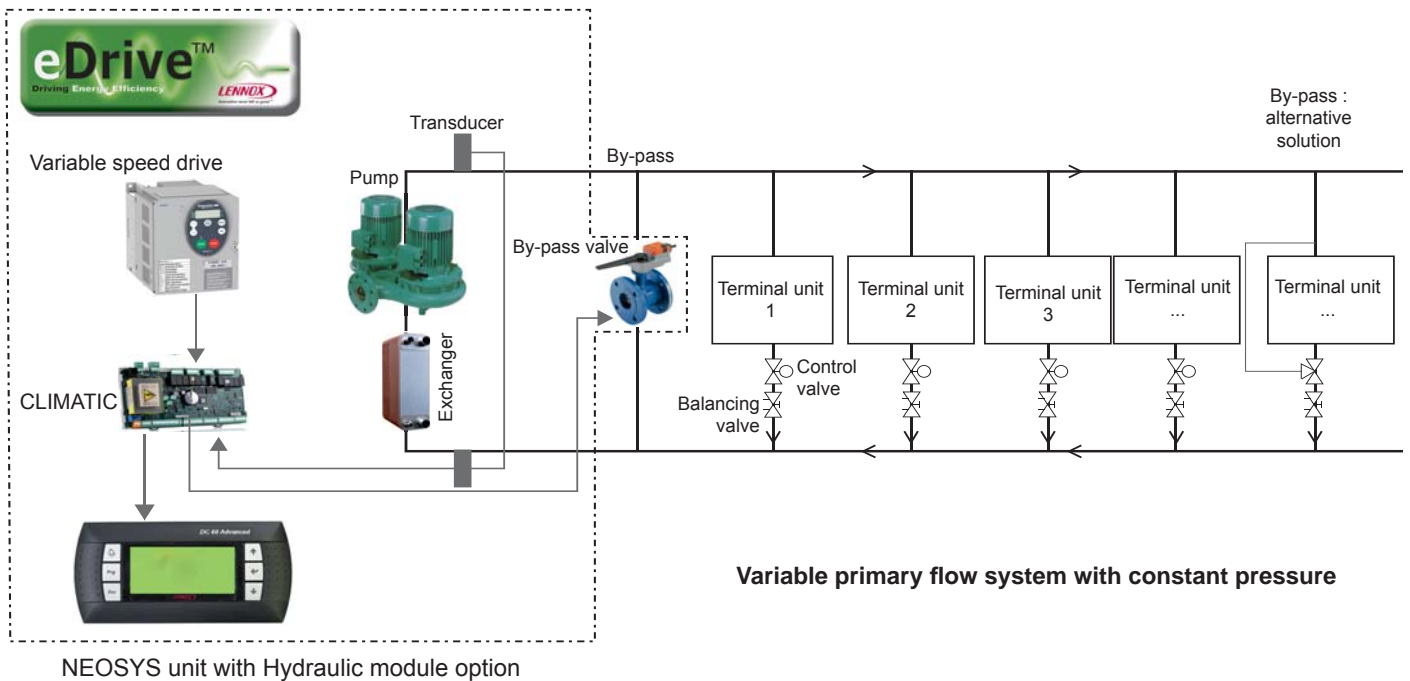

PUMP AFFINITY LAWS

“The power required for pumps varies as the cube of the flow rate.”

20% water flow reduction = 50% energy reduction.
40% water flow reduction = 80% energy reduction.

eDrive™ VARIABLE WATER FLOW MAY SAVE MONEY IN THE SYSTEM DESIGN COST

A variable primary flow design uses fewer components than primary–secondary systems as the pumps of the secondary distribution loop and the mixing tank are eliminated.

When compared with constant primary flow systems, terminal units can be equipped with two-way control valves instead of three-way valves often used in constant volume systems. Using two-way valves instead of three-way valves on fan coils represents a budget reduction that pays for the variable frequency driver cost. On top of that, the water flow set valve is eliminated as the pump adjustment to real installation needs can be done electronically. These factors may reduce the initial cost of the chilled water system.

eDrive™ VARIABLE WATER FLOW BY LENNOX

3 control modes available :

Constant speed

- Interest to set the right installation design flow (avoid setting valve).

Constant Delta P (setting to declare the required working pressure)

- Implementation and management adapted to systems with two-way valves and bypass of the installation to ensure a minimum water flow back into the evaporator.

Constant Delta T (Setting to declare the required delta T)

- Need a good installation with well balanced circuits to ensure good flow distribution when the flow is reduced.
- Installation with terminal units fitted with 3-way valves.

Operation for each mode:

- Constant speed : eDrive pilots the pump to the water flow desired when the compressors are in operation. When the compressors are stopped (dead zone), control will automatically reduce the speed of the pump to the minimum water flow. This minimum flow is also adjustable within minimum 30Hz (60% flow).
- Constant delta P : the eDrive™ regulation is managing the pump to maintain the required delta P in order to keep constant the customer available static pressure. When the terminals control valves close in response to decreased building loads, the pump controller slows the pump speed to maintain the target delta P. In this mode the pump does not detect terminal capacity reduction (fan speed staging)
- Constant Delta T : the eDrive™ regulation is managing the pump to maintain the required Delta T. When the Delta T is increasing in response to the number of compressors running, the pump controller increases the speed of the pump. Conversely, when the compressors are stopping in response to decreased building loads, the pump controller slows the pump speed to maintain the target Delta T.

Safety parameters:

- If the evaporating pressure reaches the low limit (risk of evaporator frosting), the flow is increased.
- If the outlet evaporator temperature reaches the low limit, the flow is set to the maximum.
- When the pump speed varies and the flow switch trips, the flow is automatically increased.
- During defrost procedure (HP), the flow is set to the maximum.
- Pump motor supply range from 30 Hz minimum to 50Hz maximum. Minimum pump motor frequency set at 30 Hz. Below this value, risk of pump motor failure due to overheat.
- For safe operation of the chiller, the unit is protected by the flow switch.
- Minimum and maximum admissible water flow per unit size: with constant delta T, the flow may vary from 60% to 100% of the selected pump nominal flow.
- Maximum change in flow rate through the evaporator: a 10% per minute change in flow rate is admissible in most of air conditioning applications.

Installation instructions to respect in case of variable primary flow:

- The hydraulic system will have to be properly designed and balanced to ensure a right water flow distribution through the chiller evaporator and the terminal units.
- The hydraulic system will have to be properly designed to respect minimum and maximum water flow through each chiller following the values given by the manufacturer.

Case of constant Delta P mode :

- In case of system designed with terminal units equipped with 2 way valves, the hydraulic system will need to have a bypass flow to ensure a minimum water flow through the chiller evaporator.

Méthode de by-pass :

- Bypass adequate water flow can be achieved with a slow modulating opening as soon as the water flow rate is near the minimum. When the water flow rises according to predefined setting, this valve closes. This bypass modulating valve provided by LENNOX (contact customer service) is controlled by our Climatic control. The bypass should be positioned at the beginning of the installation near the unit and allows significant energy savings and cost as opposed to a location at the end of the system.
 - An alternative is to install some 3-way valves at different points of the terminal units. This approach allows constant minimum flow in the chiller or heat pump and ensures a cheaper system.
-
- The minimum water flow through the chiller evaporator will need to respect a minimum value that is 60% of the nominal chiller water flow.
 - The flow bypass from chilled water supply to chilled water return can be done with a motorized bypass valve opened via a signal from a flow meter.
 - For safe operation some terminals can be equipped with three way control valves in order to ensure the flow will not drop below the minimum value at any load condition.
 - The water flow must not vary by more than 10% per minute. If the flow rate changes more rapidly, the system should contain a minimum of 6,5 liters of water per kW instead of 3 liters/kW.
 - Check the control valve authority in low load periods, especially in case of long pipe hydraulic systems.

Compared with the basic configuration, this option features an additional refrigerant/water heat exchanger on the compressor discharge line, allowing recovery of 15% of the rejected heat. This heat exchanger is large enough to recover heat for the production of free hot water simultaneously with chilled water production. The heating capacity of the heat recovery circuit is approximately equal to the power input of the compressor. Typical heat recovery applications can be facilities with high domestic hot water usage, such as health care, hotels, etc.

Partial heat recovery

Notes:

This option is available on cooling only and heat-pump versions. Heat recovery can only occur when the unit is running either in cooling or heating mode.

Wf :
Water flow in m³ per hour

Dp :
Water pressure drop in KPa

Heat recovery is one of our solutions to decrease and offset energy bills continually on the rise.

NEOSYS with Heat Recovery option operate as a standard chiller as long as heat is not required or simultaneously produce chilled and hot water which can be used for applications like preheating of a boiler, heating or domestic hot water.

Heating or preheating in series with a boiler, the heat recovery option enables to reduce :

- Purchase and installation cost : boiler is undersized.
- Operating cost : free hot water when unit produce chilled water.

In series with an auxiliary heater , this option can also replace the heater in low temperature heating systems.

A heat recovery chiller is suitable for all industrial process requiring both chilled and hot water.

The LENNOX total heat recovery system on NEOSYS :

- Parallel assembly, stainless steel brazed plate heat exchanger mounted in parallel to the air condensers maintain maximum performance and efficiency whatever the conditions : 100% heat recovery in opposite of series assembly.
- Free hot water from 25 to 55°C
- Very Low refrigerant charge, no additional refrigerant charge thanks to braze plate heat exchanger.
- High Total Energy Ratio values : TER (*)
- Standard Features factory mounted and tested:
 - Stainless steel heat exchanger with control
 - Paddle water flow switch
 - Temperature hydraulic sensors
 - Victaulic coupling
 - 3 way valve (0-10V) for cold start
 - On/Off pump control
 - Antifreeze protection + insulation (in option)

(*) TER: Total Efficiency Ratio is the total energy efficiency of the units when there is a production of chilled water and hot water simultaneously. Cold water and hot water are valued to the total power consumption of the unit: $TER = (\text{cooling capacity} + \text{recovered heating capacity}) / \text{total power consumption}$.

Control principle:

The unit switches to recovery mode using a dry contact supplied by the user and connected to the CLIMATIC. CLIMATIC controller regulates the water leaving temperature of the recovery exchanger using temperature probes included at inlet and outlet of the exchanger. It offers the possibility of programming schedule one or more setpoints.

Recovery capacity is entirely dependent of the cooling needs. The capacity step is important due to two independent refrigerant circuits and varies depending on the number of compressor ;

Unit with 4 compressors

| Cooling capacity step | Heat recovery step |
|-----------------------|--------------------|
| 27% | 27% |
| 53% | 27% or 53% |
| 73% | 53% or 73% |
| 100% | 53% or 100% |

Unit with 6 compressors

| Cooling capacity step | Heat recovery step |
|-----------------------|--------------------|
| 17% | 17% |
| 33% | 17% or 33% |
| 50% | 33% or 50% |
| 67% | 33% or 67% |
| 83% | 67% or 83% |
| 100% | 50% or 100% |

CLIMATIC provides a dry contact to control the on/off of the pump(s). It also delivers a 0 -10V signal to control a 3-way valve to avoid cold start if the inlet water temperature is too low ensuring the correct operation of the unit. The use of a 3-way valve can be avoided by using a variable speed pump. This solution allows for greater control of the output temperature of water and thus to reduce the power consumption of the pump. Protection against lack of water flow is provided by a paddle flow switch included in the option.

Total heat recovery : 100%

Compared with the basic configuration this option features one or two additional V free cooling coils at the back of the unit. The free cooling includes two motorised valves, allowing the chilled water to run through the free-cooling coils, which uses less power and utilises the lower ambient air to cool the water. The cooling capacity of one V free cooling coil at 0°C ambient is approximately 100 kW. NEOSYS free cooling system is using the same fans and speed inverters as for the standard unit in order to keep the same acoustic capabilities. The hydraulic module options are compatible with the Free Cooling option but glycol is of course required.

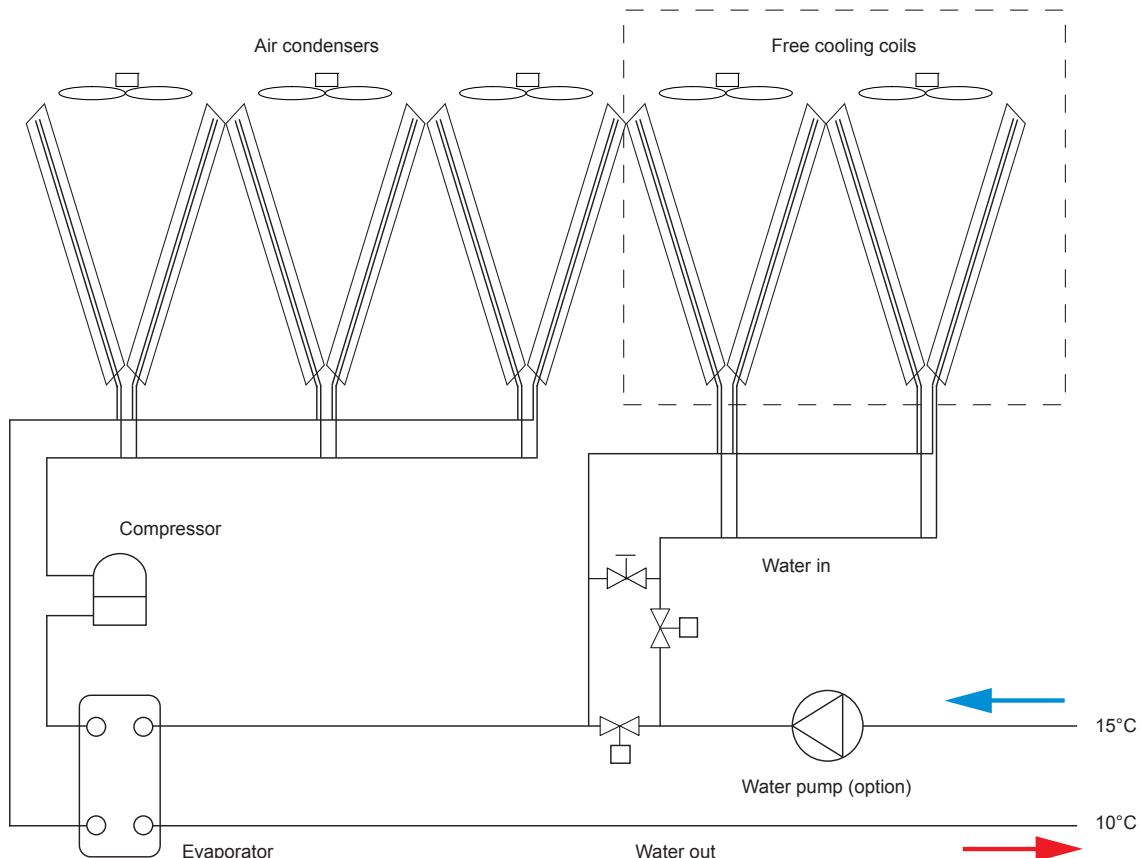

Typical free cooling applications can be facilities with cooling demand all along the year, such as offices with high internal loads like computer rooms, data centers, etc. In the North and North-East part of Europe, the ambient temperature is below 5°C between 20 and 45% of the year that makes this option very attractive.

Control principle

The control principle is the following: if ambient Temperature < return Temperature – 3°C, motorised valves open to by-pass return water flow through the Free Cooling coils. The Free Cooling fans are driven by the CLIMATIC 60 via a specific PID algorithm. The Free cooling operation is considered as a cooling stage that has a priority on the compressor stages: only if the free cooling fan speed has reached the maximum fan speed then the compressors are allowed to run with their own PID.

Advantages of the NEOSYS free cooling system

- Simultaneous compressor cooling capability to reach building needs in any conditions (vs. DX free cooling that can not operate simultaneous compressor and free cooling).
- Design with additional V free cooling coils to eliminate unnecessary air pressure drop when running 100% in compressor cooling mode thus reducing all along the year energy fan consumption (vs. traditional free cooling system with free cooling coils located in series with the condensing coil.)
- Free cooling as soon as the air outside is cold enough (3°C below return water temperature).
- Reduce the running use of the compressors.
- Extend the life expectancy of the compressors.
- EER up to 63 (Water 15/10°C, Air -15°C).
- Reduce power costs.
- Payback could be as little as 12 months

Example of free cooling:

Unit running 100% in free cooling mode:

Return water temperature: 12°C (30% glycol)

IMPORTANT NOTE : Thanks to variable speed fans, maximum sound level can be reduced. NEOSYS maximum air flow can be adjusted between 70 % and 100 % of the nominal airflow to meet maximum sound level requirements.

NAC

Please contact LENNOX for noise level calculations at reduced airflow.

Performance data are available up to 52°C on request

Values in grey cells : derating capacity, compressor(s) unload due to high discharge temperature
 N/A : Pressure drop of derating capacity need to be calculated thanks to page 15

Pf :
 Net cooling capacity in kW

Pe :
 Effective absorbed power in cooling mode

Wf :
 Water flow in m³ per hour

Dp :
 Water pressure drop in KPa

Performance data are available up to 52°C on request

Values in grey cells : derating capacity, compressor(s) unload due to high discharge temperature
 N/A : Pressure drop of derating capacity need to be calculated thanks to page 15

Pf :
 Net cooling capacity in kW

Pe :
 Effective absorbed power in cooling mode

Wf :
 Water flow in m³ per hour

Dp :
 Water pressure drop in kPa
