INTRODUCTION

CLIMATIC^{TM}50

The new generation of microprocessor based control, CLIMATIC^{TM} 50 may be fitted to the Lennox chiller range. It inherits 15 years of technology and field operating experience from its predecessors the CLIMATIC^{TM}1 and CLIMATIC^{TM} 2.

LENNOX has found the latest hardware technology available on the market place and developed a software specifically designed for water chiller applications, maximising the LENNOX units efficiency and performance.

Compatibility

This documentation is compatible with following programs:
- Ecologic ranges, from version 50.10
- Ecomax ranges, from version 50.6

Warning

Any parameter modification should be carried out by trained and licensed competent technician.

Before start-up or restart of a unit controlled by Climatic 50, it is mandatory to check adequacy between Climatic 50 and the unit with its options.

- **38xx menus for unit and options**
- **39xx menux for communication**

In case of wrong parameters, I/O links could be incorrect and may create some operation problems for the units and ultimately breakdowns.
Lennox cannot be held responsible for any claims on the units due to a wrong parameters sequence or a parameters modification carried out by non competent technicians. In this case, the warranty will be legally null and void.

WIRING CONNECTIONS AND COMMUNICATIONS

IMPORTANT WARNING

Any wiring modification on the CLIMATIC 50 must be done by Lennox technician or employees having valid electrical qualification and authorisation.

For any modification of wiring on the 24V supply or on 4-20mA sensor, check the polarity prior to apply the power. Wrong polarity may cause serious damage and destroy the Plan network. Lennox will not accept liability for damage caused by wrong power connection or any wiring modification done by people without valid training and qualifications.

CLIMATIC 50 CONTROLLER - OPTION DC50 REMOTE CONNECTION
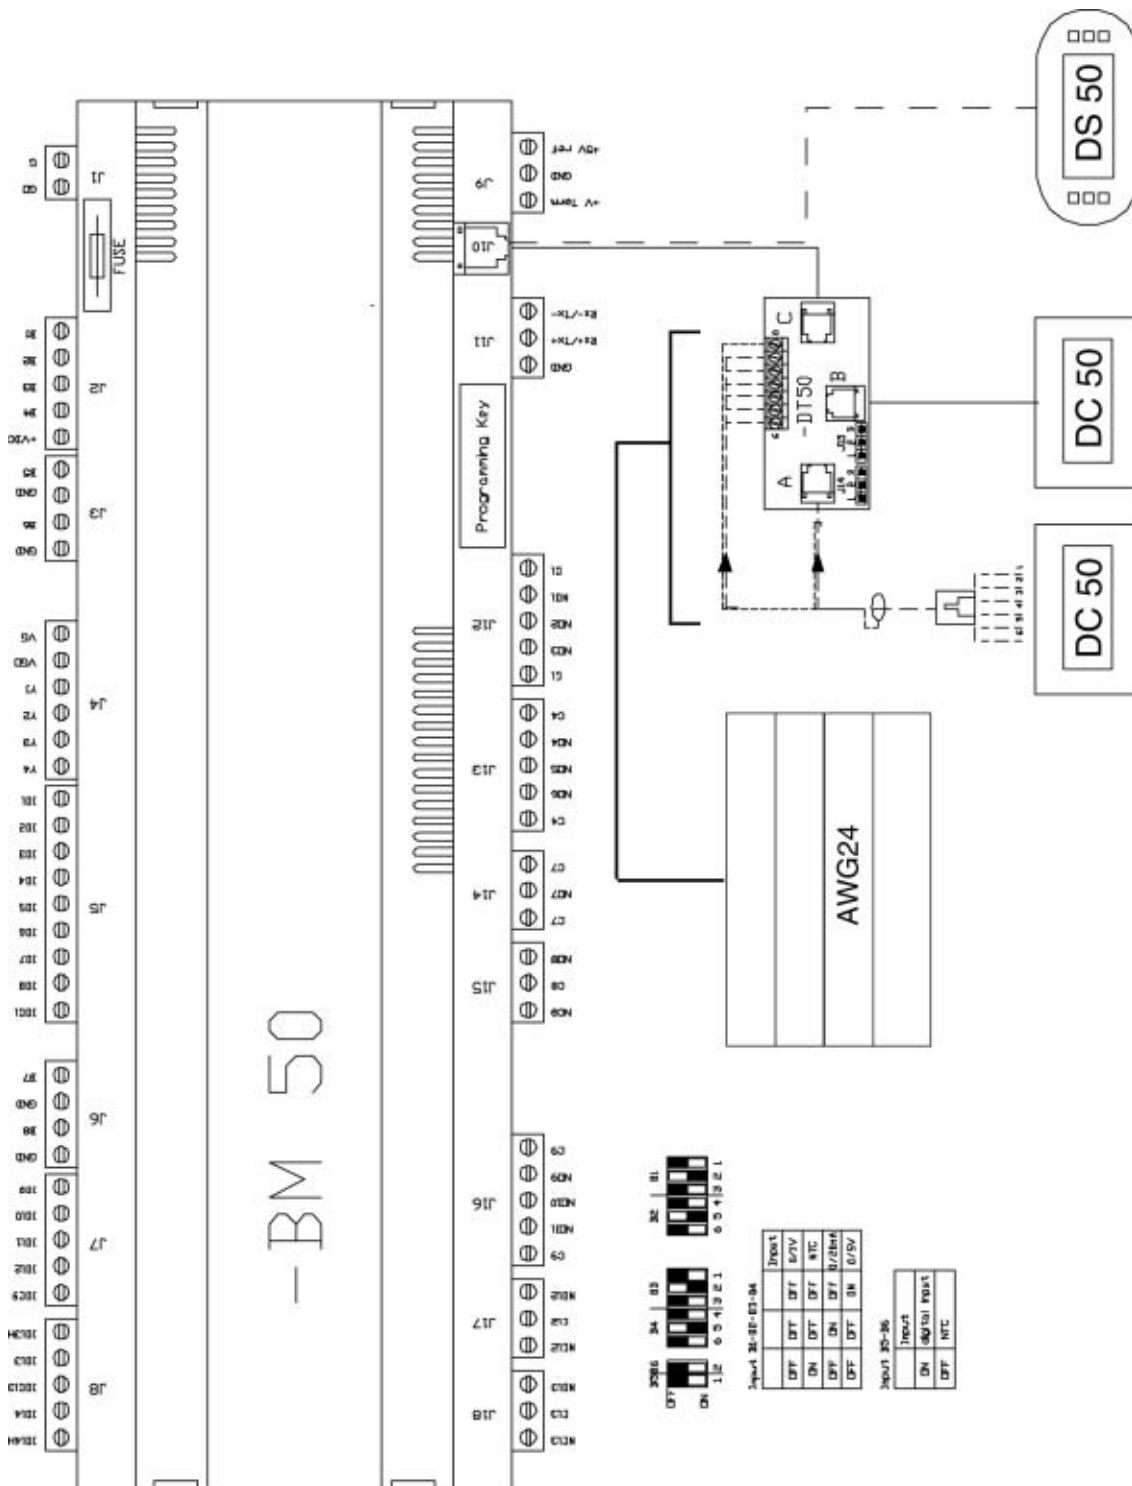

WIRING CONNECTIONS AND COMMUNICATIONS

COMMUNICATION

BMS
Function

This is used to link a Climatic to a BMS network for remote control of the unit.

Description

The Climatic 50 can communicate according to various protocols:
1. Climatic protocol for connection with KP06 (see specific KP06 manual) or other Lennox communication products (3932 = Climatic)
2. MODBUS Protocol (3932 = Modbus)
3. LONWORKS system (3932 = LonWorks)

MODBUS and LONWORKS address table are given at the end of this manual.

The identification number of each unit can be set (3931) and the communication speed is adjustable between 1200Bds and 19200Bds (3933).

MODBUS protocol
For this option the BM50 must be equipped with the board, PCO1004850
This card is used to interface BM50 to an RS485 network.
The card guarantees the optical isolation of the controller from the RS485 serial network.

On the Climatic, set point 3932 = ModBus

Transmission Mode = RTU
Baud Rate = set point 3933 (1200 / 2400 / 4800 / 9600 / 19200)
Word Length = 8
Parity = NONE
Stop Bits = 2

Device Id = set point 3931 (1 to 200)

LONWORKS protocol
For this option the BM50 must be equipped with the board, *PCO10000F0*
This card is used to interface BM50 to a LonWorks® network, by FTT-10A 78 kbs (TP/FT-10).

On the Climatic, set point 3932 = LonWorks

Baud Rate = set point 3933 (4800)

Device Id = set point 3931 (1 to 200)

Application

Normally the Climatic works on its calendar zones of operation (Zone A, B, C, Unoccupied).

Warning: The points in writing received from the BMS are taken into account by Climatic only if mode BMS is activated ("Watchdog", address 3934)
The BMS mode is activated if the watchdog is different from zero (DS50 address 3934, Modbus analogical item1, Lonworks address I_Sp_BMS_Dog).

Every second, the Climatic 50 decreases the value of this address by 1. If this address reaches zero, then the Climatic 50 works as a stand alone unit in order to check continuously the communication with BMS. Normally, the BMS has to send a value to this address regularly (example 255 every 4 mn).

WIRING CONNECTIONS AND COMMUNICATIONS

COMMUNICATION

MASTER/SLAVE
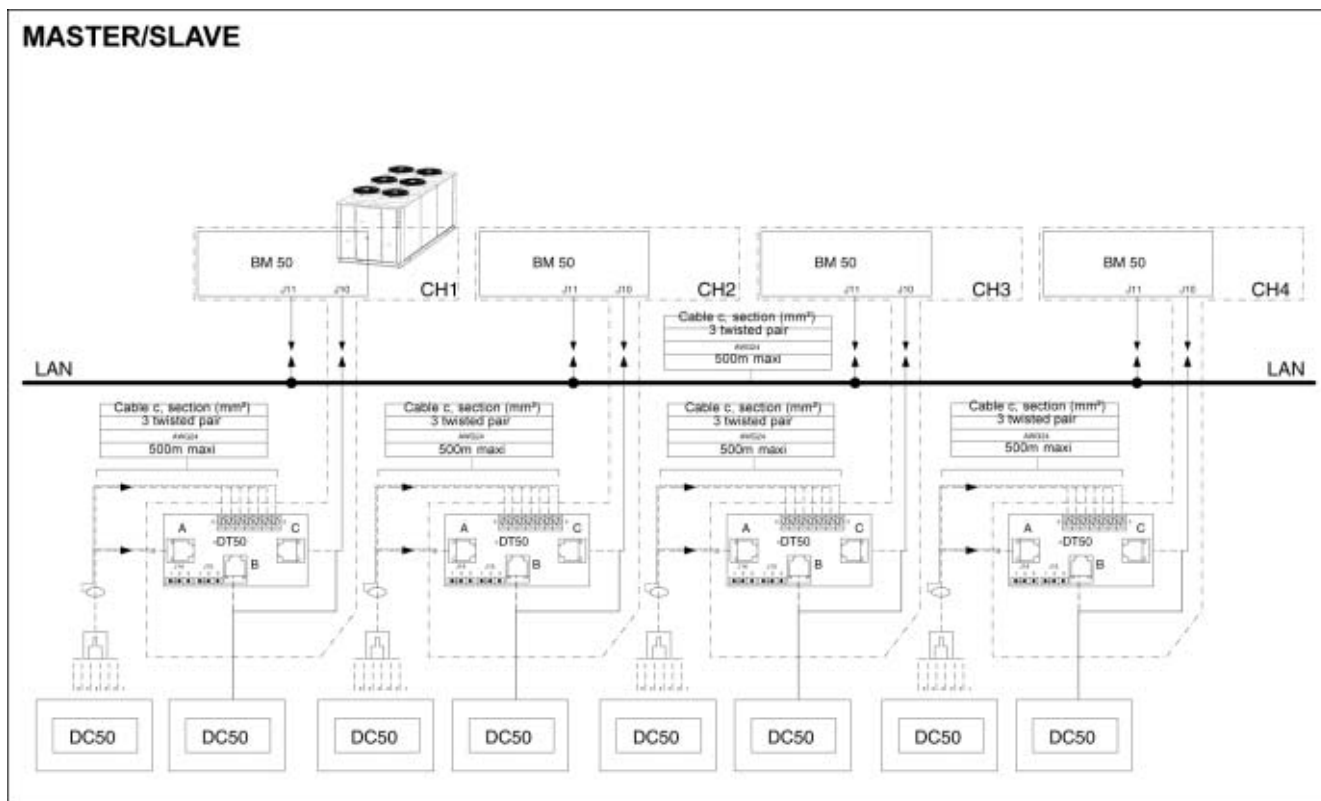

Function

Link several units in order to allow a "Master/Slave" relationship in between each units

Description

Three modes are available and can be set up using following set points:

3922 → number of units linked (maximum 4 for Ecologic range, 2 for Ecomax)
3923 → Operation mode:

- Back-up mode
  One unit is the back-up unit and will operate if any of the other units has a failure.
- Rolling Back-up mode
  Same as above, except the "back-up" unit will change every Tuesday at 2 am.
- Cascade mode
  No back-up unit. During start-up, the units' capacity steps are started in cascade unit by unit.

In every case, the outlet water temperature (set point 3924) and/or the outside air temperature (set point 3925) used for regulation can be set by using following calculations:

- Not used   → Each unit regulates with its own sensors
- M/S Temp   → Slaves units regulate with Master sensors
- M/S Aver   → Every units regulate with the global sensors average value

In every mode, for the management of safety, each unit remains independents.

LAN configuration

On the LAN network, each unit needs to be addressed:
- Unit n°1   → Master unit
- Unit n°2 to 4   → Slave units

For the configuration of each unit address on the LAN network, refer to DS50 Service display chapter.
Page 53 and above

Each DC 50 has to be addressed to its correspondent unit. In order to do so, please refer to DC50 Comfort Display page 43 and above.

Both operations must be done without network connection (connector J11 on BM50).

If a unit has electronic expansion valves, the driver address must be corrected as explained in the correspondent chapter page 20 and above.

SCHEDULING

Function

Controlling operation of the unit according to the time and day

Description

CLIMATIC^{TM} 50 can handle 4 time zones over the 7 days of the week:
- Zone unoccupied
- Zone A
- Zone B
- Zone C

Starting time (hours and minutes) of each of these zones for each days of the week, can be set using menus 3211 to 3214, (press PROG key to change day).

> 3211 → Starting time Unoccupied Zone (hour, minute)
> 3212 → Starting time Zone A (hour, minute)
> 3213 → Starting time Zone B (hour, minute)
> 3214 → Starting time Zone C (hour, minute)

	8h00	12h00	14h00	20h00	
Monday	**Unoccupied**	ZA	ZB	ZC	**Unoccupied**
Tuesday					
Wednesday					
Thursday					
Friday					
Saturday					
Sunday					

For each time zone the following set points can be adjusted:

1. Pump control type. Set point 3112, (refer to the "pump control" pages for more details).
2. Change Over rules for heat pump units. Set point 3311 must be set for each time zone
3. Heating and cooling temperature set points. Set point 3321 to 3325 for cooling and 3331 to 3335 for heating (refer to the control set point pages for more details)
4. Compressor operation. Set point 3411 (refer to the compressor operation pages for more detailed information)

With DS50, for each set point, press PROG key to change time zone and validate the right set point in the right zone

Note: "Monday" is the first day of the week for the scheduling on CLIMATIC^{TM} 50

As a factory setting, only Zone A is activated 24hours a day, 7 days a week

ANTICIPATION – Heat pump mode only

Function

This allows an anticipated start-up in the morning depending on the outdoor temperature.

Description

This function only works for zone A, and allow the machine to move from unoccupied zone to zone A earlier if the outdoor temperature is under a certain value.

This will allow the unit to anticipate a cool day.

This can be adjusted with set point 3221 and 3222.

> 3221 → bottom of the slope (°C), Anticipation starting point .
> 3222 → Slope in Minutes of anticipation per degrees

Example:
WA chiller with Zone A starting at 8.00 am
3221 set at 3°C
3222 set at 10mn/°C

If outside temperature is 0°C, the zone A will start at 7.30 am
CHANGE OVER – REVERSIBLE UNITS

Function

For reversible units only. this allows the reversible units to change automatically from winter to summer operation.

Description

This function will change the unit from production of hot water to production of chilled water automatically and can be set up with following set points:

3311 → Change over mode according to following values
                Cool. Only   → cooling only
                Heat. Only   → heating only
                Auto.   → Automatic change over - pumps are running in dead zone
                Auto. Stop   → Automatic change over – pumps are stopped in dead zone
3312 → Change over winter setting
The set point 3312 is the outside air temperature under which the unit will operate as a heat pump.

3313 → Change over summer setting
The set point 3313 is the outside air temperature over which the unit will operate as a chiller.

Example:
                3312 = 12°C
                3313 = 23°C

                12°C   23°C   Outside air temp
EVAPORATOR PUMP(S) CONTROL

Function

Ensure the presence of a flow rate of heat transfer fluid in the evaporator heat exchanger.

Description

Seven types of control rules can be set. They are defined using the menu 3112 on the DS50 Service Display.

- If 3112 = Started ....CLIMATIC^{TM} 50 does not control the pumps
- If 3112 = Stopped, ...Pumps are stopped.
- If 3112 = P1 Only ....CLIMATIC^{TM} 50 Control only runs pump n°1.
- If 3112 = P2 Only ....CLIMATIC^{TM} 50 Control only runs pump n°2.
- If 3112 P1N P2R ....CLIMATIC^{TM} 50 Control handles both pumps with N°1 as standard and N° 2 as backup.
- If 3112 = P2N P1R ....CLIMATIC^{TM} 50 Control handles both pumps with N°2 as standard and N° 1 as backup.
- If 3112 – Clock ....CLIMATIC™ 50 controls handles both pumps equalizing running times and switching from one pump to the other every Tuesday at 02h00 am.

This

Pump N°1 is running if all of the following conditions are met:
⇨ At least one ON/OFF of circuit "n" is ON
⇨ Unit remote ON/OFF is ON *
⇨ NOT in the unoccupied zone*
⇨ Set point 3112 is not set to "Stopped"
⇨ Configuration 3841 is not set to "No"
⇨ Pump has been stopped for 1 minute or is already running.
⇨ There is no electrical fault on the pump
⇨ There is to « flow rate » fault

* These conditions are ignored if the outdoor temperature is below set point 3341 + 1°C and if the outlet water temperature is below set point +1°C, in order to prevent the water from freezing.

A pump can be controlled by the CLIMATIC^{TM}50 even if electrically the network pump is not handled by the refrigeration unit.

In the case where the customer is handling the control of his own pump, the following procedure must be followed:

- Start the pump at least 1 minute before validating the remote ON/OFF switch operation.

- Switch off the pump 2 minutes at least after the remote ON/OFF switch has gone to 0.

<u>In the case of double pumps</u>

The pump N°k is running if all of the following conditions are met:

⇨ The conditions detailed above for the single pump must be met for the pump k

⇨ In the case of forced operation, pump N°k is running (set point 3112 is set to "P1 Only" for pump N°1 and "P2 Only" for Pump N°2)

⇨ When running « Standard/Backup » Operation, pump N°k has priority (Set point 3112 set to "P1NP2S" for Pump N°1 and "P2NP1S" for pump N°2).

⇨ In the case of "equalized run time" operation the running time of pump N°k is the smallest

In case of a fault on a pump when the set point 3112 is set to « P1NP2S », « P2NP1S » or « Clock », the second pump, if available, will automatically start.

NOTE: CLIMATIC^{TM} 50 control only stops the pumps 2 minutes at least after the request to switch the whole unit OFF has been given, in order to prevent any risks of freezing the evaporator heat exchanger.

THERMOSTAT – Set point calculate

Function

Set the chilled or hot water circuit temperature, depending on the outdoor conditions in order to optimise the energy consumption.

Description

Calculation of the chilled water set point :

Values are given for indications only.
Gradient can be positive or negative.

3321
10°C

3322
7°C

3323

Temperature
THERMOSTAT - Control principle

Function

Adjust and hold the fluid outlet temperature as close as possible to the set point, by controlling the number of compressor stages depending on the thermal load on the system.

Description

CLIMATIC™50 control constantly calculates the required capacity to reach the temperature set point.
This variable is called "CAPACITY FACTOR" (CF) and its value can vary from 0 to 100%.
It is directly linked to the number of control stages of the unit.
i.e.: For ecologic WA 230D K STD with 6 control steps, the CF will start and stop a step at the following values:**0-17-33-50-67-83-100**
It then evolves following the principles detailed in the diagram below (This applies to a chiller):
In any Cases, for a chiller, if the Low Water temperature limit is reached, Compressors are stopped.

In order to anticipate, the reference point is recalculated each time the difference between water temperature and set point reach a minimum or a maximum.

The rate of change of the Capacity Factor (CF) is determined by another parameter called "REACTIVTY" and which value is in:

$$\% \text{ of CF } / \text{ °C (Diff vs Set point) } / \text{ min}$$

REACTIVITY for Cooling Mode can be adjusted in menu 3325
REACTIVITY for Heating Mode can be adjusted in menu 3335

Moreover, the **(3326)** set point limits the power factory in cooling mode, and the **(3336)** set point limits the power factory in heating mode.
The control calculates the difference between the Inlet and Outlet water temperature.

Example:
For a unit with two screw compressors, with six steps (16.6% by stage); if the (3326) set point is equal to 5°C, then 5 / 6 = 0.8°C
And if the chilled water supply temperature set point is equals to 7°C the power factory can go up to the 16.6% (1 stage) only if (T.Inlet - T.Outlet) > 0.8°C

Then the power factory can go up to the 32.2% (2 stages) only if (T.Inlet - T.Outlet) > 1.6K, and so…

COMPRESSOR CONTROL

Function

Compressor steps are started and stopped in a pre-determined order which minimized the effect of the « anti- short cycle protection and equalized running time.

Description

☞ *Compressor Starting and Stopping Sequences*
This Sequence is determined by the calculated compressor running time. This control also includes the automatic and instantaneous back up of a compressor by another one if it becomes unavailable.

The crankcase heater is supplied when the compressor is turned off. More the feed back of the carter resistance circuit breaker is connected with the ON/OFF unit circuit.

☞ *Starting and Stopping Compressors*
Compressor XXX starts if all the following conditions are met :

⇨ *The water circulation pump has been running for at least 1 minute.*

⇨ *Remote ON/OFF switch for the complete unit is ON*

⇨ *The ON/OFF control for the considered circuit is ON*

⇨ *The unit, the compressor and the circuit do not have any "Majors Alarm" ON*

⇨ *The control requires the start-up of a compressor.*

⇨ *XXX is the compressor with the lowest run time amongst the stopped compressor. To see the run times for each compressor refer to menu: 2419, 2429….2469*

⇨ *Compressor XXX was not started for at least 6 minutes. The state of each compressor can be checked in the following menu: 2412, 2422, 2432…, 2462*

HIGH PRESSURE UNLOADING

Function

Reduce the capacity of a refrigeration circuit before the HP cut out is reached

Description

High Pressure Unloading consists in reducing the variable capacity on a screw compressor, or to stop one compressor on units fitted with tandems or trios. The value of the high pressure unloading can be adjusted in menu 3616.
Note that in the menu the pressure unloading is expressed in bar relative. If in menu 3616 the value is set to the maximum the unloading function is then disabled. In this case there will be no compressor unloading until the high pressure cut out is reached.

Factory set points for menu 3616:
        Ecologic = 26.5 bar (R407c)
        Ecomax = 22 bar (R407c)

☞ *Activation of High Pressure Unloading*

If High Pressure is over the compressor unloading set point (menu 3616) and carries on increasing as all the fans are running full speed, one compressor is stopped, or one stage of capacity reduction (for screw compressors) is activated on the affected circuit.

DEFROST – Heat Pump

Function

Avoid the ice on the Evaporator while the reversible unit works in winter operation

Description

To avoid the icing of the external air exchanger in winter operation, it is necessary to reverse the refrigerant cycle on a regular basis to de-ice by heating the exchanger.

The defrost is activated when the air temperature is under a set point (3432) and the LP is lower than a set point (3433)

While defrost is demanded, the defrost cycle is as following:

1. Stop compressor and fans
2. Wait 5s
3. Reverse 4 way valve
4. Wait 5s
5. Start compressor
6. When HP reach 20b (R407c) or compressor are running for more than 4 minutes, stop compressor
7. Wait 5s
8. Reverse 4 way valve
9. Start fans at full speed in order to dry the exchanger for a period that can be adjusted with set point 3435.
10. end of defrost

Two different type of Defrost demand are possible:
- Dynamic defrost (set point 3431 = Dynamic)
- Cycling defrost (set point 3431 = Cyclic)

Dynamic defrost

This allows the unit to start the defrost cycle only when required. This is achieved through the measurement of the temperature difference between the coil and the outdoor. The defrost will be initiated shortly after the Climatic50 has located the largest gradient in the curve.
Cycling defrost

The unit will start a defrost cycle with a regular time period (set point 3434)

Defrost parameters summary:

3431 → Defrost mode: dynamic – cyclic
3432 → Outside air temperature under which the defrost cycle is activated
3433 → LP temperature under which the defrost cycle is activated.
3434 → For the dynamic defrost the unit will run this minimum amount of time. For cycling defrost, this is the time delay to start the defrost once the temperature conditions are met
3435 → Fan running time after the defrost cycle in order to dry the exchanger.

DRIVING THE ELECTRONIC EXPANSION VALVE

Function

Control the adequate filling of the evaporator heat exchanger with refrigerant, in order to get the best efficiency, while allowing a good protection of the compressor against liquid slugging

Description

The electronic expansion valves used on units fitted with CLIMATIC^{TM} 50 are controlled using the EVD200 Driver

This driver is design to communicate with the CLIMATIC^{TM} 50 main control board through a "pLan" BUS.

The driver can be set up using the following DS50 menus:
3511, 3521, 3531, 3541 → Superheat circuit 1, 2, 3, 4
3512, 3522, 3532, 3542 → Anticipation circuit 1, 2, 3, 4
3513, 3523, 3533, 3543 → Proportional Factor circuit 1, 2, 3, 4
3514, 3524, 3534, 3544 → Integral Factor circuit 1, 2, 3, 4
3515, 3525, 3535, 3545 → Derivative Factor circuit 1, 2, 3, 4

It is highly recomended NOT TO CHANGE the factory setting of the EVD Driver

The Anticipation factor allow the pre-opening of the EEV during circuit start-up and is calculated according to the capacity at start up.

Futhermore the EVD Driver is fitted with Leds indicating its status:

Power (Green) → Shows the power is ON
Open (Green) → Flashes during the expanion valve Opening –
Stays ON when the expansion valve is Fully Open.
Close (Green) → Flashes during the expanion valve Closing –
Stays ON when the expansion valve is Fully Closed.
Error (Red) → Stays ON when Alarm is ON (Refer to Faults and Alarms section)
pLan (Green) → Stays ON when the communication is established with CLIMATIC^{TM} 50 –
Flashes when the communication is disturbed or broken.

Connexion with BM50

The address of each expansion valve driver must be set-up in order to ensure a good communication between the Climatic 50 and the diver.
The address can be changed by using the dip switches that are under the Driver cover.

Addresses must follow the rules hereunder:

Ecologic n°	BM50 address	Driver circuit n°1 address	Driver circuit n°2 address
1	1	5	6
2	2	7	8
3	3	9	10
4	4	11	12

Ecomax n°	BM50 address	Driver circuit n°1 address	Driver circuit n°2 address	Driver circuit n°3 address	Driver circuit n°4 address
1	1 2	5	6	7	8
2	3 4	9	10	11	12

The dip switches have to be positioned according to the following table:
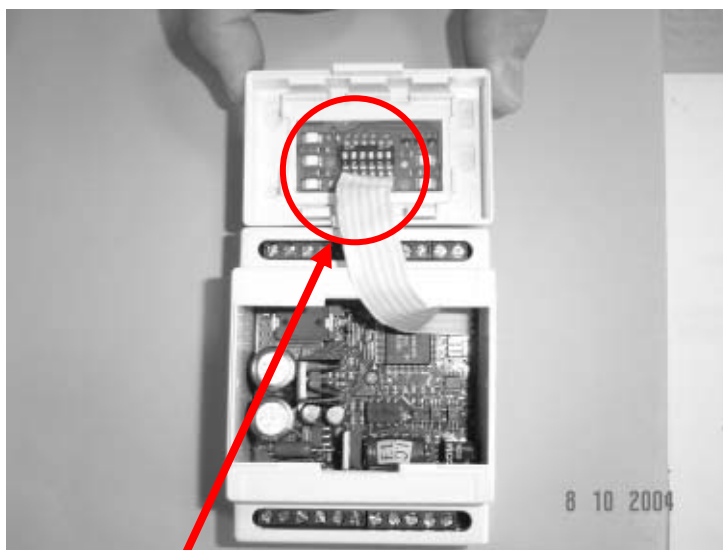

Address\\Weight	SW1 1	SW2 2	SW3 4	SW4 8	SW5 16
5	ON	OFF	ON	OFF	OFF
6	OFF	ON	ON	OFF	OFF
7	ON	ON	ON	OFF	OFF
8	OFF	OFF	OFF	ON	OFF
9	ON	OFF	OFF	ON	OFF
10	OFF	ON	OFF	ON	OFF
11	ON	ON	OFF	ON	OFF
12	OFF	OFF	ON	ON	OFF

CONDENSING FANS CONTROL

Function

Maintain the condensing pressure as stable and as low as possible in order to increase the unit performances, while avoiding excessive cycling.

Description

Identical to the complete machine control logic, the CLIMATIC^{TM} 50's aim is to reach and hold the high pressure set point. However the fan control includes a dead zone ensuring a greater stability to the High Pressure and avoiding starting and stopping the fans too frequently.

Can be adjusted using menus
3611 = High pressure control set point in bars (relative pressure)
3612 = Reactivity

Operation

On a unit with N fans per circuit, the number of stages follows the table hereunder:

Model	Number of Stages		
	PV with PWM	PV	GV
WA/RA STD/HE/SLN	1	0	N-1
WA LN	1	N-1	0

Where: PV: Low speed Fan Operation
GV: High Speed Fan Operation
PWM: Pulse Width modulation (only on PV)

CASE 1 Unit **without** PV or PWM

The **Ventilation Factor** "**V.F.**" is calculated using the evolution of High Pressure (measured using the HP sensor) and the rate at which it is moving away or towards the High Pressure Set Point (3611). See diagram page 12.
It also includes a dead zone of 5 bars (4 bars if the unit has glycol and water set point <0°C) and a sampling time constant of 15 seconds.
As for capacity control, the **reactivity** will fasten or slow down the **VF** evolution
 Example: Unit with 3 fans, one circuit and HP set point 3611 is set to 15 bars
- Pressure > 15 bars → **V.F.** increasing
- 10 bars < Pressure < 15 bars → **V.F.** unchanged
- Pressure < 10 bars → **V.F.** decreasing
CASE 2 Unit **with** Low / High Speed control or PWM

The **Ventilation Factor** "**V.F.**" is calculated using the High Pressure measured using the HP sensor and the rate at which it is moving away or towards the High Pressure Set Point (3611). It also includes a dead zone of 5 bars and a sampling time constant of 15 seconds.
 If menu set point 3611 is set to 15 bars
- Pressure > 17 bars → **V.F.** increasing
- 12 bars < Pressure < 17 bars → **V.F.** unchanged
- Pressure < 12 bars → **V.F.** decreasing

Ventilation Factor "**V.F.**" can be seen in menu 2222 to 2225 on the DS50
For example on a unit with 3 Fans
The "**PWM factor**" which is used to adjust the speed of the fan when it is running in PWM
This **PWM Factor** "**PWM.F**" is calculated using the High Pressure measured using the HP sensor and the rate at which it is moving away or towards the High Pressure Set Point (3611). The sampling time constant is 5 seconds.
 If menu set point 3611 is set to 15 bars
- Pressure > 15 bars → **PWM.F.** increasing
- 14 bars < Pressure < 15 bars → **PWM.F.** unchanged
- Pressure < 14 bars → **PWM.F.** decreasing
Value for **PWM.F** can be seen on menu 2619, 2629, 2639 and 2649 on a DS50

Note: Moreover, the fan control anticipates the power factory of the fan. In other words, when a compressor is switched on, the power factory is calculated in according to 3xT° Outside.
(T° Outside = Outside Temperature)
For example, if T°Outside = 20°C, then FP Fan = 3x20=60%

CUSTOMIZED INPUT / OUTPUT (BE.50)

Function

With the optional expansion board BE.50, it is possible to customize some input / output for remote control of the unit. So it is possible to customize:

- 4 digital outputs NC or NO (connectors J5, J6, J7, J8) set up with parameters 3851, 3852, 3853 and 3854
- 4 digitals inputs (connectors J4 ID1, ID2, ID3, ID4) set up by parameters 3861, 3862, 3863 et 3864
- 4 analogical inputs (4-20mA or Lennox NTC temperature probe on connectors J9 B1, B2, B3 and B4), set up with parameters 3871, 3872, 3873 et 3874

Description

So it is possible to set up the following functions:

With 3851, 3852, 3853 and 3854 - digital output NC or NO free contacts - following information could be recovered on each contact:

- Fault fans or pumps or water flow or circuit 1, 2, 3 or 4.
- Heating mode
- 100% on Circuit 1, 2, 3 or 4
- Unit fully loaded – 100%
- Unit-ON
- Unoccupied mode operation
- Zone A, B ou C
- BMS mode

With 3861, 3862, 3863 and 3864 - digital input 24V AC or DC – following orders can be sent on each contact:

- Switch water set point (set point 1 / set point 2)
- Force Heating mode
- Force Cooling mode
- Disable circuit 1, 2, 3 or 4.
- Force unoccupied mode

With 3871, 3872, 3873 and 3874 – analogical input 4-20mA or Lennox NTC probe (J9 B1, B2, B3 and B4) – It is possible to make the following actions:

- Set point offset(*)
- Free temperature probe connection. The measured value will be displayed on following addresses 2191, 2192, 2193 or 2194.

(*) The 4-20mA signal sent to the unit is converted linearly using a -5K to +5K range of temperature set point.
<u>For example</u>**:**
For a unit set point of 7°C supply temperature, a 20mA signal will give a 12°C return temperature set point.

In any case, with a unit running with clear water, the chilled water supply temperature set point CAN NOT be adjusted to a value below 6°C.

FREE-COOLING

Function

Ensure optimum cooling capacity though the use of free cooling, therefore reducing electrical consumption.

Description

☞ *Free-cooling principle*
TEE ⇔   Chilled Water Inlet temperature (°C)
TSE ⇔   Chilled Water Outlet temperature (°C)
TEA ⇔   Outdoor air temperature (°C)

☞ *Control of the free-cooling 3 way valve*

     3 way valve is activated if the following conditions are met.
⇨ The free cooling function on the Chiller is activated by switching the menu 3843 to "ON"
⇨ The unit is running
⇨ Ambient air temperature (TEA) is below the set leaving chilled water set point minus 3°C
⇨ Chilled water circulation pump has been running for at least 30 seconds

☞ *Control of the free-cooling fans*

In the case where the free cooling fans are the same as the main refrigeration circuit fans, (which is the most common case for Lennox units), they are constantly running if the compressors are stopped and if the chilled water outlet temperature is above the set point defined in menu 3321 and 3322.
When a compressor starts, the fans run as without free-cooling.
In the case where the fans of one circuit are running full speed for at least 3 minutes, the cooling by free cooling only is not sufficient to reach the chilled water set point, the control allows the compressors of that circuit to start.

In the case where the free cooling circuit is independent from the main refrigeration circuit (separate fans and coils), the free cooling fans are allowed to run for as long as the chilled water outlet temperature has not reached the set point defined in menu 3321 and 3322.

☞ *Compressor Operation*

For the compressor control, if the outside temperature is lower than the chilled water inlet temperature, the free-cooling is considered as an additional first compressor stage by the control.

ENERGY RECOVERY

Function

Heat recovery function ensures a constant supply of hot water through an additional water cooled condenser while keeping an optimum cooling capacity.

Description

☞ *Energy recovery Principle*
☞ *Activation of the energy recovery function*

The energy recovery function on the Chiller is activated by switching the menu 3844 to "ON"

☞ *Energy recovery control*

The amount of heat recovery that can be achieved and the hot water temperature can be adjusted by changing the ventilation pressure set point. (Refer to ventilation adjustment section for details)

FAULT CODES

CHILLED WATER TEMPERATURE, OUT OF RANGE

Fault Code: **012, 013, 022, 023**

Description

Water Inlet or Outlet Temperature measured by the temperature sensor is outside the authorised range, this range can vary depending on the presence or not of glycol with the chilled water (factory setting)

TE < set point 3341 (chilled water min set point) or TE > set point 3342 (Hot water max set point)
TS < set point 3341 (chilled water min set point) or TS > set point 3342 (Hot water max set point)

Where:

TE	⇔	Water inlet Temperature (°C)
TS	⇔	Water outlet Temperature (°C)
3341	⇔	Minimum chilled water Temperature at evaporator (°C)
3342	⇔	Maximum chilled water Temperature at evaporator (°C)

Action

☞ Compressor immediate shutdown

☞ A fault signal is shown on the display.
- 012, Outlet water T° too high
- 013, Intlet water T° too low
- 022, Outlet water T° too low
- 023, Intlet water T° too high

☞ The remote fault signal is delayed by 6 minutes

Reset

Automatic reset of the fault signal as soon as the chilled water temperatures comes back in the authorized operating range with a safety offset of 2°C on the chilled water and 5°C on the hot water.

Water
 Set point 3341+2°C < TE < set point 3342 -5°C
 Set point 3341+2°C < TS < set point 3342 -5°C

Possible causes	Solving the problem
Faulty Chilled water inlet or outlet temperature probes	Replace the probe.
Wiring problem with the probes, disconnect the sensor.	Check the probe connections.

INSUFFICIENT WATER FLOW RATE

Fault Code: **001**

Description

The flow switch FSE is detecting a low water flow rate in the evaporator heat exchanger for more than 3 seconds

Action

☞ Immediate shutdown of the whole unit.
☞ A fault signal is shown on the display.
☞ The remote fault signal is delayed by 6 minutes

Reset

The unit restarts **automatically, 20 seconds** after the flow switch detects a flow rate.

Possible causes	Solving the problem
Problem with the pump control wiring.	Check the pump connections
Problem with the flow switch wiring	Check the flow switch connections
Dirty or clogged water filter.	Clean the water filter.
Wrong setting of the flow switch.	Check the flow switch settings.

COMMUNICATION WITH THE EXTENSION BOARD

Fault Code: **071**

Description

The communication between the BM50 and the BE50 is down.

Action

Alarm signal is ON
The unit carries on running

Reset

The fault signal disappears **automatically as soon as the communication is back on line**.

Possible causes	Solving the problem
Damaged BM50 or BE50	Replace the defective component
Bios mal function	Update Bios up V3A.57 or 3.64 and above
Wrong wiring or loose connection between BM50 and BE50	Check connections and wiring.

COMMUNICATION WITH THE SLAVE BOARD

Fault Code: **076**

Description

The communication between the BM50 Master and the BM50 Slave is down.

Action

Alarm signal is ON
The unit carries on running

Reset

The fault signal disappears **automatically as soon as the communication is back on line**.

Possible causes	Solving the problem
Damaged one of the BM50	Replace the defective component
Bios mal function	Update Bios up V3A.57 or 3.64 and above
Wrong wiring or loose connection between the two BM50	Check connections and wiring.

LOW PRESSURE CUT OUT

Fault Code: **1n7**

Description

The low pressure cut out limit depends on the type of refrigerant which is inside the circuit and is defined as following:

R407C ⇨ 1,5 bar abs. (Or –28°C Vapour Saturated Temperature).

One compressor on circuit n does not work for 2 minutes and in the case of a unit with low ambient kit and Thermostatic Expansion Valve, the TXV bypass valve has been closed for 1 minute, but the low pressure is too low.

NOTE: Only units with thermostatic expansion valves and Low ambient kit options are fitted with TXV bypass.

Action

☞ If the Low Pressure of a circuit is below the safety limit for more than an hour, then the considered circuit is not allowed to start again.

☞ This circuit is shut down immediately.

☞ A fault signal is shown on the display.

☞ The remote fault signal is delayed by 6 minutes.

Reset

Automatic reset of the fault signal as soon as the low pressure moves above the "CUT OUT" limit

If the low pressure fault is activated more than three times during the same day, the fault signal is locked out and must be reset manually.

The auto reset limits are detailed below

R407C ⇨ 2.5 bars abs. (or –16°C saturated vapour temperature).

Note: Fault counter is cleared and reset every day at 10 am, as long as the maximum number of faults has not been reached.

Possible causes	Solving the problem
Not enough refrigerant in the circuit.	Adjust the refrigerant charge
Faulty expansion valve.	Check the good working of the expansion valve.
Dirty filter drier.	Change the filter drier
Faulty low pressure sensor.	Replace the low pressure sensor.

EVAPORATOR FREEZING PROTECTION

Fault Code: **1n8**

Description

This fault signal is activated on units chilling water without frost protection additives (Water without Glycol or Brine) and with thermostatic expansion valves.

One compressor from the considered circuit n has been running for at least 2 minutes and the saturated temperature TBPn is lower than the set point 3421 for more than 5 seconds (for units filled with R407c).

This safety feature is disabled for 2 minutes after start-up or stop of a compressor or a fan on the considered circuit.

With:

TBPn   ⇔   Evaporating Temperature of circuit n - dew point (°C)

3421   ⇔   Minimum Evaporating Temperature (°C)

Action

☞ Immediate shutdown of circuit n

☞ Fault signal sent to the control display.

☞ The remote fault signal is delayed by 6 minutes

Reset :

The first 3 faults are **automatically** reset
After three faults the circuit n can only be restarted by a **manual reset**

Note:

Fault counter is cleared and **reset every day at 10 am**, as long as the maximum number of faults has not been reached.

Possible causes	Solving the problem
Faulty LP pressure sensor	Replace the pressure sensor.
Faulty wiring or loose sensor connection.	Check pressure sensor connections and wiring.
Insufficient water flow rate in the evaporator.	Check flow rate and adjust flow switch if necessary.
Clogged evaporator	Clean evaporator.
Check set points	Replace pressure sensor.

FAULT PROBES AND SENSORS

Fault Code: **081, 083, 086, 087, 089, 1n1, 1n2, 2n6**

Description

One or more temperature probes or pressure sensors located on circuit n or elsewhere are short circuited, cut or disconnected.

Probe or sensor affected by the problem
Water inlet temperature probe → code 081
Water outlet temperature probe → code 085
Air temperature probe → 083
Heat recovery exchanger inlet temperature probe → code 086
Heat recovery exchanger outlet temperature probe → code 087
High Pressure Sensor → Code 1n1

    Unit without EEV
Low Pressure Sensor → Code 1n2

    Unit with EEV
Low Pressure Sensor or suction probe → Code 2n6

Action

  ☞ *Immediate shut down of circuit n for faulty sensors.*
  ☞ *Immediate shut down of ALL circuits for faulty water outlet temperature and air temperature probes.*
  ☞ *No shut down for the other faults.*
  ☞ *Fault signal shown on the display.*
  ☞ *The remote fault signal is delayed by 6 minutes.*

Reset

The unit returns to normal operation after the signal from the faulty probes or sensors is re-established.

Possible causes	Solving the problem
Damaged probes or sensors	Remplace probe or sensor
Wrong wiring or loose connection on a probe or sensor	Check probes and sensors connections and wiring.

COMPRESSOR ELECTRICAL PROTECTION

Fault Code: **1n4**

Description

During start up or operation of a compressor m:

- The thermal magnetic trip breaker or the compressor internal protection from circuit n is tripped
- The phase rotation protection has detected an incorrect connection (standard on screw compressor and available as a special request on other units)
- The discharge line thermostat is tripped out (screw compressors only)

Action

☞ Immediate shut down of compressors m from circuit n.
☞ Fault signal shown on the display.
☞ The remote fault signal is delayed by 6 minutes.

Reset

If the fault signal comes from the internal compressor protection, it can be automatically reset. In this case, Climatic 50 will restart the concerned circuits 30 minutes after shutdown.
After three **automatic** reset of the compressor fault signal, the circuit n can only be restarted by a **manual reset** of the fault signal.

Important: For manual reset of ZR 380 internal protection cut off; if the problem comes from a high discharge temperature, wait for 30 mn prior to any manual reset to allow the scroll temperature to decrease sufficiently. If the temperature is still too high, the compressor will trip again just after starting.

Notes:

Fault counter is cleared and **reset every day at 10 am**, as long as the maximum number of faults has not been reached.

The fault signal is reset automatically with each powering of the unit

Possible causes	Solving the problem
Wrong wiring or tightening of the connections.	Control all connections
Wrong setting on the circuit breaker	Set circuit breaker according with compressor normal running current

HIGH PRESSURE TOO HIGH

Fault Code: **1n5**

Description

High pressure switch from circuit n has tripped.

Action

☞ Immediate shut down of circuit n.
☞ Fault signal shown on the display.
☞ The remote fault signal is delayed by 6 minutes

Reset

The first 3 faults are **automatically** reset
After three faults the circuit n can only be restarted by a **manual reset**

Notes:

Fault counter is cleared and **reset every day at 10 am**, as long as the maximum number of faults has not been reached.

Possible causes	Solving the problem
Dirty condenser.	Clean the condenser.
Wrong setting on the condenser control.	Check the settings of the controller.
Wrong operation of the liquid line solenoid valve	Check the operation of the solenoid valve.
Fan out of order	Change the fan
Wrong wiring or wrong setting of the high pressure, pressure switch.	Check the wiring and the setting of the HP switch.
Dirty Filter Drier	Change the filter drier.

INSUFFICIENT FLOW RATE PROVIDED BY THE PUMP

Fault Code: **001 040**

Description

Pump k supplying flow rate to the evaporator has been ordered to start for **20 seconds.**
The flow switch FSE is detecting insufficient flow rate in the heat exchanger for more than **25 seconds**.

Action

Case 1 :
The unit only handles **ONE pump**

☞ Immediate shut down of compressors and pump k.

☞ Fault signal 001 is shown on the display.

☞ The remote fault signal is delayed by 6 minutes

Case 2 :
The unit handles **TWO pumps** and the "Normal/ Safety" mode or "Clock" has been activated.

☞ Immediate shut down of pump k.

☞ Start up of the 2nd pump (refer to "EVAPORATOR PUMP(S) CONTROL" section for more details)

☞ If the FSE is detecting a flow rate, then the fault 040 is shown on the display, the unit is then running normally

☞ If the FSE does not detect any flow rate the fault 040 is shown on the display, the unit is then shut down

☞ The remote fault signal is delayed by 6 minutes

Reset

In all cases implying a shut down of the unit, 3 start up attempts are made then after these three faults per day the unit can only be restarted by a manual reset

Notes:

Fault counter is cleared and **reset every day at 11 am**, as long as the maximum number of faults has not been reached.

Possible causes	Solving the problem
Problem in the pump control wiring.	Check the pump connections
Problem with flow switch wiring.	Check the flow switch connection
Dirty water filter	Clean the water filter
Wrong setting of the flow switch	Adjust the setting of the flow switch

FAN(S) CIRCUIT BREAKER(S) OPEN

Fault Code: **90, 92, 93, 94, 95**

Description

One or more thermal magnetic trip circuit breaker protecting the condenser fans are tripped

Ecologic unit → Fault code 90
Ecomax unit circuit 1 → code 92
Ecomax unit circuit 2 → code 93
Ecomax unit circuit 3 → code 94
Ecomax unit circuit 4 → code 95

Reset

The fault is cleared automatically as soon as the fans circuit breakers are closed

Possible causes	Solving the problem
Wrong wiring or tightening of the connections.	Control all connections
Wrong setting on the circuit breaker	Set circuit breaker according with compressor normal running current

PUMP(S) CIRCUIT BREAKER(S) OPEN

Fault Code: **041, 042**

Description

The thermal magnetic trip circuit breaker protecting the pump k has tripped

Action

Case 1 :
The unit only handles **ONE pump**
☞ Immediate shut down of pump k.
☞ Immediate shut down of the unit.
☞ Fault signal shown on the display.
☞ The remote fault signal is delayed by 6 minutes

Case 2 : The unit handles **TWO pumps**.
☞ Immediate shut down of pump k.
☞ Start up of the 2nd pump (refer to "EVAPORATOR PUMP(S) CONTROL" section for more details)
☞ Fault signal **041** is shown on the display for Pump 1 and **042** for Pump 2
☞ The remote fault signal is delayed by 6 minutes

Reset

The fault **is automatically** reset as soon as the pump circuit breaker is closed.
If the unit was stopped (case 1), the unit will restart automatically **20 seconds** after the fault signal has disappeared and the climatic 50 has restarted the pump.

Possible causes	Solving the problem
Wrong wiring or tightening of the connections.	Control all connections
Wrong setting on the circuit breaker	Set circuit breaker according with compressor normal running current

Display Connections and Dip Switches Configuration

See page 4: "Connection diagram: CLIMATIC™ 50 controllers – option DC50 remote connection"

DC50 COMFORT DISPLAY

This display is mounted on the panel of the unit and can be also used as a remote controller; this display is designed for non-technician user. This display gives information such as flow or pump status, set point and outside air temperature. It does not allow access to detailed operating data.

It can be used to set or change the scheduling of the different time zones, the temperature set point for each zone.

It also has the capacity to set a 3 hours override and to force the unoccupied mode or any of the different time zones for a period of up to 7 days. It displays the real time clock and different faults signals.

Display

Type FSTN graphic
Back light: Green LEDs
Resolution 120x32 pixels
Power Supply
Voltage from main Climatic board
Max power: 0.8W

Remote Installation

The optional DC50 is designed to be mounted on the wall.
- Fit the cable from the DT50 board through the back piece
- Fasten the back piece to the wall using the rounded head screws supplied in the packaging
- Connect the cable from the main board on the **RJ12** plug on the back of the DC50 display
- Fasten the front panel on the back piece using the flush head screws supplied
- Finally fit the click-on frame
Terminal connection board installation guide DT 50

The board is fitted with three "telephone" RJ12 plugs. Ensure the board is correctly connected.
Standard connection is:

- Climatic on connector C
- Unit DC50 on connector A
- Remote DC50 on connector SC
- DS50 on connector B

Jumpers:

"Displays" are supplied directly by the Climatic board with 30Vdc. Take particular care at the path this 30V is taking when several boards are being used.

J14 and J15 can switch on or off the direct current from the power supply:

J14 and J15 set between1-2
Connectors A, B, C and screw connector SC are in parallel. Power supply available to all connectors.

J14 and J15 set between2-3
Connectors B and C are in parallel but line 1 and 6 don't reach connector A and screw connector SC.
"Displays" connected to these ports will not be powered.
If J14 and J15 are set in different positions the "terminal connection board" DT50 DOES NOT WORK.

NOTE:
When a shielded wire is used the metallic case of the "Terminal connection box" DT50 must be earthed.

RJ12 PIN connection
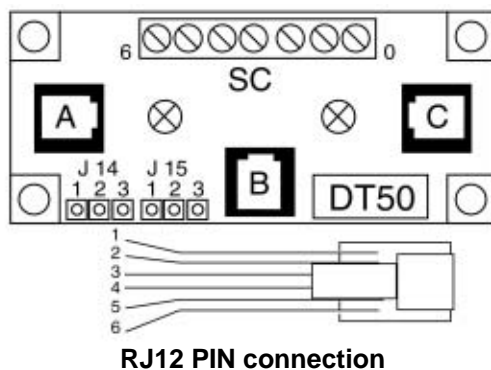

SC Terminals	RJ12 Pin conn	Description
0	+	shield / earth
1	1	+VRL=30V
2	2	GND
3	3	Rx- / Tx-
4	4	Rx+ / Tx+
5	5	GND
6	6	+VRL=30V
Terminal display address configuration

The address of the terminal must be checked after having powered the board.

- To access the configuration mode, press ↑↓↵ together and hold them for at least 5 seconds.
- The screen shown below will be displayed with the cursor flashing in the top left hand corner.
- To change the address of the terminal display press the ↵ key once.
- Use the ↑↓ keys to select the desired value and confirm by pressing ↵.

- If the address was changed it will display the below screen.

Assigning Terminal displays to control boards.

- Access the configuration mode by pressing ↑↓↵for at least 5 seconds.

NOTE: To access the board address menu you must go directly to the bottom of the first screen (shown in below screen) without changing the terminal address as explained above.

- Press the ↵ key until the cursor moves to the field "I/O Board address :XX" (below screen)
- Use the ↑↓key to select the correct Climatic board.(N° of Unit)

- Pressing ↵ again will display the screen shown below :
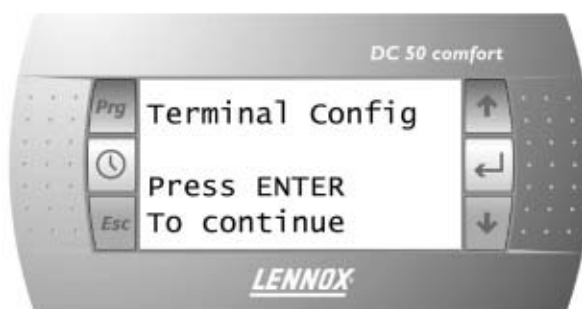

- Pressing ↵ again will display the screen shown below.
- The field "P:XX " shows the address of the selected board. In the example the value "12" has been selected.
- The filed under the "Adr" column represents the addresses of the terminal displays associated with the board that has the address "12", while the column under "Priv/Shared " indicate the type of terminal selected.
- Ph: Private
- Sh :Shared
- Sp : Shared Printer (N/A)
- To exit the configuration procedure and save the data, select the filed "OK?NO", choose "Yes" using the ↑↓ keys and confirm by pressing ↵ .

- If the terminal remains inactive (no button is pressed) for 30 seconds, the configuration procedure is aborted automatically.

High pressure cut out

Switching ON or OFF the unit or
Forcing a selected time zones for a period of up to 7 days

Pressing the return key on the main screen will display the following message:

Do you want to:
Switch off unit:NO
Choose override:Uno
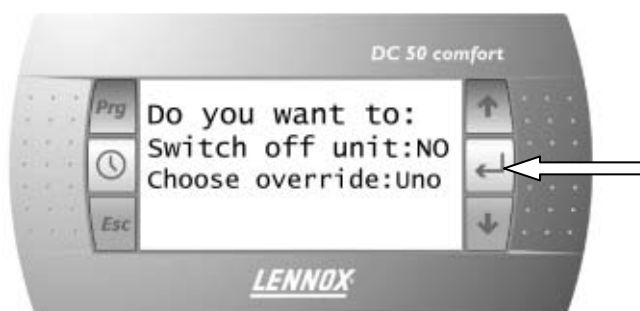

Pressing the return KEY validates the choice and move to the next field
Up and down arrows gives you the choice between different things

If you choose "YES" to the first question the unit is **SWITCHED OFF** and you can not access the override menu.

WARNING: Switching Off the unit disable all safety Protections

If you choose to stop the Unit in the previous screen the following screen will then appear**.**

12.0 OFF

The unit can then be switched back **ON** by pressing the return key once more.

If the first choose is "NO" then the override screen can be accessed a particular time zone can be forced for up to 7 days starting from the day "TODAY".

In this menu you can choose the number of days you want the selected time zone to override.
Increase the number of days by pressing the Up or down keys.
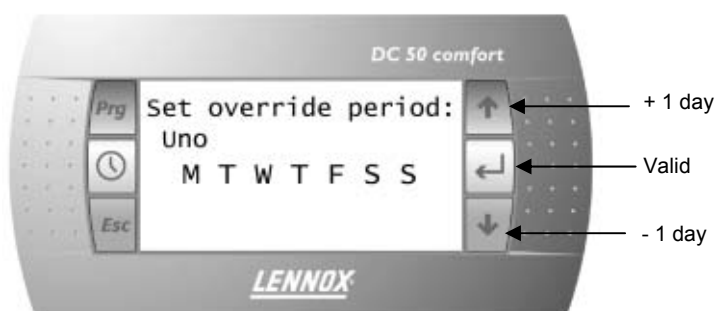

DS50 SERVICE DISPLAY

This display is usually is a plug and play feature designed for technician people.

Keys

Short cut to Alarm menu

Change time zone

Go back to previous screen

Move up in a menu or increase value

Enter Valid Select

Move down in a menu or decrease a value

Start up screen or Screen (1)
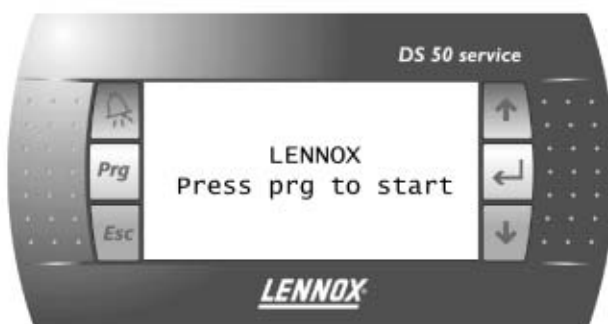

Screen (2) language selection

Start

Ten languages are now available (DE, FR, GB, IT, NL, PL, PT, RO, SP, TR), but only two out of these ten are downloaded in the factory. So, the required language must be specified at the time of order.
If needed, other language will be downloaded on site by Lennox technicians.
In this menu the specified language can be selected using the up and down keys. The "prg" key validates the choice and start the controller

Main menu (0000)

(1000)01   Alarm 02
01-03/03.12h10 * 127
02≥03/03.12h05 * 125
03-27/02.12h03 = 125

Selected Alarm

Alarm code

Alarm Date and Time

Active* or Inactive =
Pressing the "ALARM" key resets all the alarms
The number of active alarms goes to 0, no active alarm shown in the menu, the "bell" key is switched off.
DS 50 service

(1000)01   Alarm 00
01-03/03.12h10 = 127
02≥03/03.12h05 = 125
03-27/02.12h03 = 125

Select

NOTE: It's possible to clear all the faults on the terminal display DC50 or DS50. Once in the "Alarm" Menu, (1000) you just have to push the "ALARM" button for more or less 15s. Then all faults will be erased (Date and time). If the fault is still present, it will be show again once the end of the reset.

Pressing the "return" key will display details of the selected alarm
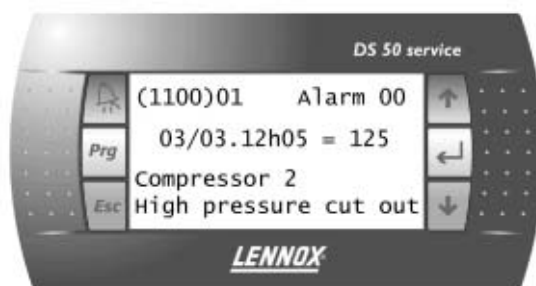

Clock settings

The clock setting menu can be accessed from the main menu by selecting the menu "SETTING" and then navigating down through the sub-menus until page (3120).
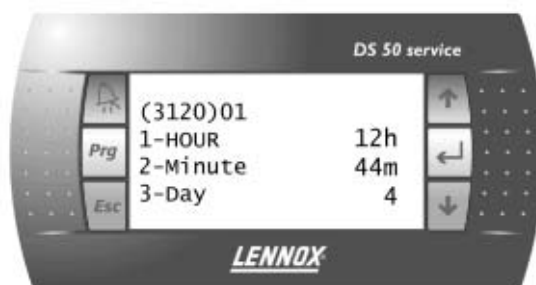

Selecting the HOUR for displays the page 3121 shown bellow:
Zone Settings

From Main menu (0000) navigate down to sub-menu "SETTINGS", zone settings (3320).

"Prg" changes the time zone ——

```
                              DS 50 service
    ⎕    (3320)01        Zone.A   ↑
         1-SP WAT.1      07.0°C
  Prg    2-Sp wat.2      07.0°C   ↵
         3-Sp Out.1      22.0°C
  Esc                             ↓
              LENNOX
```
In this particular page, pressing the "prg" key, changes the time zone. If "SP WAT.1" is selected, this displays the Minimum Water Outlet Temperature Set Point for the specific time zone shown in the top corner.

```
                              DS 50 service
    ⎕    (3320)01        Zone.A   ↑
                         min:05.0
  Prg    Sp Wat.1        std:07.0 ↵
  Esc    07.0°C          max:17.0 ↓
              LENNOX
```
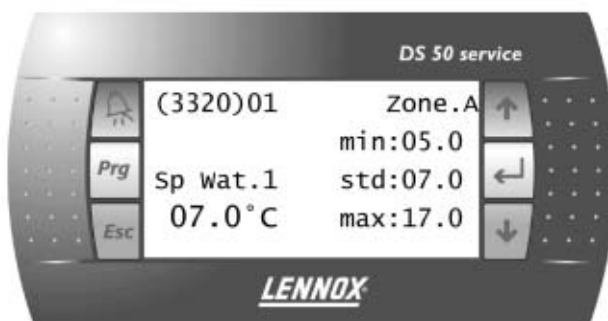

Pressing the "**prg**" validates any changes made, and moves to the next time zone. "ESC" does not validate the changes and move back one step in the menu tree.

Special screens for diagnostic

For unit operation diagnostic, it is helpful to use the special following screen which can be reached by pressing the Prg key while being on the screen 2400:

1. Main unit operation (water temperature vs set point , compressor operation, capacity factor)

Capacity factor (%)

Set point Cooling and/or Heating (°C)

```
                              DS 50 service
         C: 07.0  100.0  14.2    ↑
         H:               08.5

```
5. <u>Master / Slave operation (number of connected board and ID, cascade function with indication of next unit to start, Standby with indication of unit in standby)</u>

Number of the next unit to start.

Number of the unit in standby.
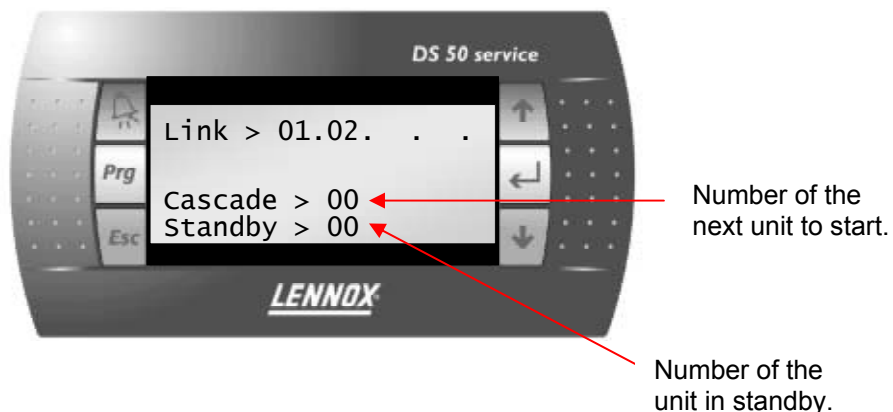

BM 50 address configuration

It may be necessary to change BM50 addresses on the LAN network - mainly in case of Master / Slave installation. Follow the procedure hereunder to do so:

1. Change the DS50 address to 0

- Turn the power OFF/ON on the BM50, then access the configuration mode by pressing ↑↓↵for at least 5 seconds until you reach the following screen:
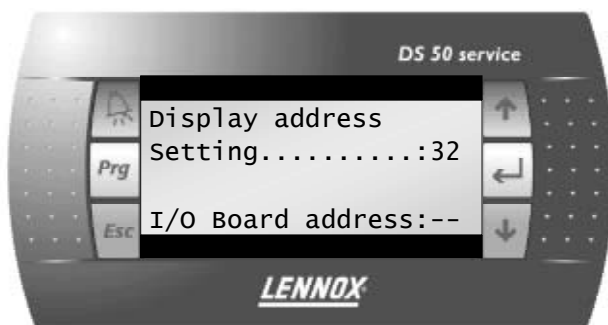

By using ↑ ↓ keys Change the Display addresses setting to 0 (instead of 32 as standard value) and validate with ↵ key.

2. Change the BM50 address

Shut off the power on the BM50 and then turn it on again after 5 seconds, then press alarm and ↑keys in order to get the following screen

Then you will get:
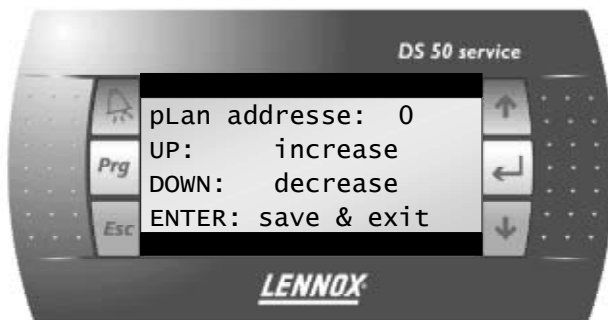

By using ↑ ↓ keys Change the pLan address to the correct value (1 to 4) and validate with ↵ key.

3. <u>Change the DS50 address</u>

Set back the DS 50 address to its normal address (32) with the relevant procedure.

Lighting Contrast

The display has auto contrast lighting function, but you can also adjust it manually. To adjust the lighting manually press the 'Alarm' and 'Prg' keys together and then press the ↑ and ↓ keys to increase or decrease the contrast.
