

5.1.5 Microprocessor setting

Check that the desired thermal and humidity parameters are set in the microprocessor.

If the preset parameters need to be changed, proceed as described in the microprocessor manual (see attachment).

 Standards units are designed to work with room temperature between 22 e 27 °C (50% humidity), working at lower temperature can cause frost covering the evaporator.

5.1.6. Steam production setting (unit with humidifier)

Steam production must not exceed 60-70% humidifier max. capacity, this will ensures a longer operating life of the equipment.

In order to set or modify operating parameters, see the humidifier manual (attached).

Table 10: Safety devices setup

Device	Intervention	Reset
High pressure switch	27.5 bar	20.6 bar
High pressure safety valve	30.0 bar	-
Low pressure switch	2.0 bar	3.5 bar

Table 11

Size of the main electric components(see also wiring diagram attached)

5.2 Fault alarm and display system

The troubleshooting is facilitated by the microprocessor, which activates an alarm and shows on its display the type of fault occurred (see also the microprocessor manual attached).

Since the alarm state is very often generated by an unfitted electric contact, in case the display shows a fault type check for all wiring connections be tighten in the terminals.

In case of fault also refer to the microprocessor manual for checking parameters setting has been done properly.

5.3 Troubleshooting

TROUBLE	POSSIBLE CAUSE	CHECK/ CORRECTIVE ACTION
1) The unit does not work	A) The electric panel is not powered	Check presence of electric tension and main switch in ON position
	B) The auxiliary circuit is not powered	Check fuse FUT and FUA
2) The conditioning unit does not start	A) The microprocessor does not start the unit	Check the electric connection to the microprocessor
	B) The external impulse to the microprocessor fails	Check the contact ON/OFF remote is closed
3) Room temperature too high (high temperature alarm signal)	A) The unit does not work	See trouble 1 and 2
	B) The control system rating is not correct	Check the rating of the control system
	C) The air flow capacity is too low	See trouble 6
	D) The compressor does not work	See trouble 13
	E) The compressor output is not sufficient	See trouble 9 and 12
	F) The control system does not work	See the attached Microprocessor manual
	G) Thermal load higher than estimated	Check the room thermal load value
4) Room temperature too low (low temperature alarm signal)	A) The control system rating is not correct	Check rating of the control system
	B) The heating elements do not work (if installed)	See trouble 15
	C) The control system does not work	See the attached Microprocessor manual
	D) Thermal loss higher than estimated	Check thermal loss value
5) Room humidity too high Only for units provided with humidity control (high room humidity alarm)	A) The control system is not properly set	Check control system setting
	B) Latent load higher than estimated	Check room latent load value
	C) The compressor does not work when in dehumidification phase	See trouble 13
	D) The control system does not work	See the attached Microprocessor manual
6) Low air flow (or absent) (high humidity probe)	A) The fans are not powered	Check the fans electric circuit
	B) Clogged filter (filter alarm activated)	Clean or replace filter
	C) Obstruction in the air duct or excess of load loss in the air duct	Check total load loss and compare with the unit delivery head
	D) Fan thermal protection system is activated	Check fan winding resistance; after reset check tension and electric input
7) The high pressure switch activates	A) The condensation pressure control system is not properly working (if present)	Check setting and working of the control system for the condensation adjustment
	B) One or more fans are out of order (ED.A, ED.M units)	Check internal thermal protection of the not working fan(s). Replace defective fans
	C) The high pressure switch is not properly set	Replace the high pressure switch
	D) Output pressure too high	See trouble 9
	E) The condensation water capacity is not sufficient	1) check correct position of all valves 2) check presence of air in the circuit
8) The low pressure switch activates	A) The low pressure switch is not properly set	Replace the low pressure switch
	B) Intake pressure too low	See trouble 12

TROUBLES	POSSIBLE CAUSE	CHECK/ CORRECTIVE ACTION
9) Compressor high pressure output	A) Air to the condenser too hot	Check presence of any condensation air re-cycle
	B) Scarce condensation air flow	Check if there are obstacles to the air flow in the exchanger coil fins (see par. Arrangements and placing)
	C) Air intake pressure too high	See trouble 11
	D) Clogged fins of the condenser coil	Clean exchanger coil removing clogging materials (paper, leaves, seeds, etc.)
	E) Circuit charged with too much refrigerant: condenser partially flooded	The under-cooling of the refrigerant too high; remove some refrigerant from the circuit
	F) Air or refrigerant not condensable in the circuit	The flow sight glass presents gas bubbles. The discharge temperature from the compressor is high; the cooling circuit must be discharged and recharged after the vacuum
	G) Water to the plate condenser too hot	Check capacity of the condensation water cooling system
	H) Condensation water capacity not adequate	Check system load loss and compare them with the pump delivery head
	I) Plate condenser encrusted	Wash the exchanger with specific product
10) Compressor output low pressure	A) The condensation pressure control system is not properly working	Check setting and working of the condensation control system
	B) Intake pressure too low	See trouble 12
11) Compressor intake high pressure	A) Thermal load higher than estimated	Check room thermal load value
	B) Output pressure too high	See trouble 9
	C) Liquid refrigerant return to the compressor intake	Check the overheating of thermostatic valve is correct; check the valve bulb is well placed, fixed and insulated
12) Compressor intake low pressure (and possible frost on the coil battery)	A) Room temperature too low	See "trouble 4"
	B) The air flow is too low or absent	See "trouble 6"
	C) Clogged refrigerant filter	Check the filter of the refrigerant
	D) Faulty thermostatic valve or not properly set	Check the overheating of the thermostatic valve is correct ; check if the element is fit
	E) Inadequate refrigerant charge	Check possible leakage and recharge
	F) Output pressure too low	See "trouble 10"
13) The compressor does not work	A) Automatic switch activated	Reset the automatic switch; look for the cause of the short circuit
	B) Compressor internal protection activated	Check compressor winding resistance; after reset check tension and electric input; check if working parameters are normal values
	C) The contact maker is not working	Check the contacts and the coil
14) The compressor is noisy	A) Liquid return to the compressor	Check working and overheating of the expansion valve
	B) The compressor is damaged	Replace the compressor
15) The heating elements do not work (if installed)	A) The safety thermostat activated	1)The air flow rate is too low, see "trouble 6)" 2) Check the safety thermostat for defect, replace it if found defective
	B) Fuses activated	Replace damaged fuses
	C) The contact maker is not working	Check the contacts and the coil
16) Alarm of one probe	The probe corresponding to the alarm code is defective or disconnected	Check the connection of the probe: in case of defect replace it.

5.4 Routine Maintenance

	Monthly	Quarterly	Annual
Filter cleaning	X		
Condensate tank cleaning		X	
Condenser coil battery cleaning (ED.A/M)			X
Humidifier cleaning		X	
Insulation and cooling lines check		X	
Compressor noise level check	X		
Fan bearings noise level check		X	
Electric connection tightening		X	
Contactor status check		X	
Insulation status of ducting check			X
Condenser water flow check (ED.W)	X		
Sight glass check		X	
Electric absorption check		X	
Working pressures check		X	
General unit condition check			X
Probe calibration check			X
Set parameter values check		X	
Refrigerant filter load drop check			X
Safety valve check			X
Pressostatic valve check		X	
Electric protections operation check		X

6 - DISMANTLING

When the unit has to be dismantled, drain the cooling circuit and collect the refrigerant gas by means of an adequate receiver, in order to protect environment, persons and properties.

 Do not release, for no reasons, the gas contained in the cooling circuit in the environment.

When dismantling the unit or when replacing the compressor, carefully collect the oil of the compressor and deliver it to an authorized company for oil disposal.

 Do not discharge, for no reasons, the oil of the compressor in the environment.

DECLARATION OF CE CONFORMITY

The manufacturer

EMICON A.C. S.P.A.

Via Dragoni, 59
47100 Forlì (FC)
Tel. (0039)-0543-411450
Fax (0039)-0543-550790

DECLARES

that the precision air conditioning unit with direct expansion

MODEL _____

SERIAL NUMBER _____

has been designed and manufactured in compliance with the essential health and safety requirements of D.P.R. 459 dated July 24, 1996 attachment 1.

The machine complies with following directives:

- Machinery directive 89/392/EEC
- Electromagnetic compatibility directive 89/336/EEC
- Low tension directive 72/23/EEC
- Dangerous substances 76/769/EEC

Following harmonized standards have been employed for the correct implementation of the essential requirements:

- EN 378-1
- EN 378-2
- UNI EN 292-1
- UNI EN 292-2
- UNI EN 294
- UNI EN 60204-1

Forlì,

EMICON A.C. S.P.A.
